They are often confounded with earlier followers of the ascetic Tatian in Syria, called Hydroparastatæ, or Water-drinkers, and reckoned among the Encratites, who used water in place of wine at the eucharist, because they held the latter to be sinful, regarding it as the evil principle or blood of the devil.

A conduit or channel for conducting water from one place to another. More particularly applied to structures of masonry and tunneling for the conducting of water from distant sources to large cities through tubular conduits. Aqueducts were extensively used in the Roman empire, and many of these ancient structures still remain. They were constructed of stone or wood, sometimes tunneled through hills and carried over valleys and rivers on arches, much of the labor upon them being uselessly expended, from a mistaken idea of the necessity of a perfectly level course. The aqueduct of Segovia, originally built by the Romans, has 159 arches, is in some parts built in two tiers 100 feet or more in height, and is an admirable monument of ancient engineering. One of the most remarkable aqueducts of modern times is that of Marseilles, to which city it conveys the waters of the river Durance from a distance of about 58 miles, of which 10 miles consists of tunnels, and a considerable portion is traversed by means of viaducts of great height and length. This aqueduct was built between 1839 and 1847, and supplies water in such abundance that the environs of Marseilles, formerly

It contains such species as the diving water-spider, *Argyroneta aquatica*. So called because they spin their webs in the water. See cut under *Argyroneta*.

aquometer (ā-kwom′e-tėr), *n.* [The analogical L. form would be **aquimeter*, < *aqua*, water, + *metrum*, measure. Cf. *aquameter*.] A steam-pump which acts both by direct steam-pressure and by vacuum. It has two working chambers, into which steam is alternately admitted. By the condensation of the steam a partial vacuum is formed, to fill which water rushes in. When the chamber is full of water a valve opens, and steam enters and forces the water out into a pressure- or delivery-chamber. The steam condenses as before, causing the inflow of a further supply of water. One chamber is filling while its companion is discharging, thus keeping up a continuous delivery. See *pulsometer* and *vacuum-pump*.

> We do not assume that a something called *aquosity* entered into and took possession of the oxide of hydrogen as soon as it was formed, and then guided the aqueous particles to their places in the facets of the crystal, or among the leaflets of the hoar-frost.
> *Huxley*, Lay Sermons, p. 136.

Arabian artists brought it to high perfection, and were at one time supposed to be its originators.] **I.** *a.* Arabian or resembling the Arabian in style; specifically, in *art*, relating to or exhibiting the variety of ornament known as arabesque. See II.

Some cushions disposed in the Moorish fashion, and ornamented with *arabesque* needle-work, supplied the place of chairs in this apartment. *Scott*, Kenilworth, I. vi.

II. *n.* **1.** A kind of ornament of a capricious and fanciful character, consisting of lines, geometrical figures, fruits, flowers, foliage, etc., variously combined and grouped, and painted, inlaid, or wrought in low relief: used especially for the decoration of walls and ceilings, but also for the decoration of objects of any nature. In the arabesques of the Mohammedans animal forms were rigidly excluded, in accordance with the requirements of their religious law; but the Greeks and Romans, and the Renaissance artists, among them Raphael and his scholars, to whom are due the rich arabesque decorations of the loggie of the Vatican, laid all the kingdoms of nature under contribution. The Greeks undoubtedly derived the idea of pictorial or plastic ornament of this kind from the Oriental stuffs, painted, woven, or embroidered with natural or fabulous forms of plants and animals, which were brought to them by Phenician traders from a very early period.

II. *n.* **1.** A native of Arabia; an Arab.—**2.** One of a Christian sect of the third century (commonly called *Arabici*) which sprang up in Perea, beyond the Jordan, a region often included in Arabia. According to Eusebius, its members "asserted that the human soul, as long as the present state of the world existed, perished with the body, but that it would be raised again with the body at the time of the resurrection." The point was discussed with them by Origen, at a council, with so much force that they were led to change their opinions.

in Arabia and other eastern countries: as, gum *arabic* (which see, under *gum*[2]); *arabic* acid. See *arabin*.—**Arabic architecture**, a general term for the Mohammedan or Mussulman, Moorish, or Saracen styles of architecture, but applied especially to Egyptian and Oriental examples. This architecture shows in its systems of construction and ornament the profound influence of Persian and Byzantine models, though, as a rule, in architectural science it falls far behind the work of the Byzantine masters. The ovoidoconical dome supported on pendentives is a characteristic feature; the buildings are usually square or polygonal in plan, seldom circular; the roofs are in general flat, and supported by arches resting on columns forming long parallel aisles, and often surrounding a central court. The arches are very commonly of the horseshoe shape developed in Persia, and from the beginning show the pointed form, though it is clear that neither form was adopted for constructive reasons, and that neither influenced the methods of building, much less revolutionized the entire art of architecture, as did the adoption of the pointed arch in western Europe. Walls, particularly interior walls, ceilings, domes, spandrels, etc., are commonly covered with an intricate lacework of arabesques, usually executed in relief on stucco, and often colored with at once great brilliancy and great delicacy. The most noteworthy examples of the style exist in Cairo.—**Arabic figures** or **characters**, the numeral characters 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, so called as having been introduced into European from Arab use. They were so introduced in the twelfth century, and the work of Leonardo of Pisa, published in 1202, contributed much to their dissemination. They were taken from the Arabic work of Al-Khowarazmi (see *algorism*), who obtained them in India or Afghanistan. The system in its complete form (with the cipher) certainly originated in India; but what the ultimate origin of the characters was, whether they had been previously known in Europe without the cipher, and their history among the Arabians, are matters still in dispute.

II. *n.* The language of the Arabians; a Semitic dialect, belonging (along with the Himyaritic and Abyssinian languages) to the southern branch of the Semitic family, and generally regarded as exhibiting more ancient features than any other Semitic tongue. It is the language of the Koran, the sacred language of Islam, and possesses an immense literature, almost wholly Moslem and later than the time of Mohammed. Many other languages have borrowed largely of its material, from the Persian, Turkish, Hindustani, and Malay on the east to the Spanish on the west.

The prevailing color of their plumage is green, often varied with spaces or bands of black, or of brilliant red and yellow. They are natives of the warm parts of South America.

Araceæ (ā-rā'sē-ē), *n. pl.* [NL., < *Arum* + *-aceæ*.] A large family of monocotyledonous plants, of which the genus *Arum* is the type. The species are herbaceous perennials, mostly acaulescent from tuberous or creeping roots, but in the tropics often tall rooting climbers. The inconspicuous flowers, usually monœcious or dioœcious, are crowded upon a spadix surrounded by a spathe, with which it is sometimes confluent. The order includes 98 genera and about 1,000 species, abundant within the tropics, but comparatively rare in temperate regions. The larger genera are *Anthurium*, *Baurasea*, *Arisæma*, and *Pothos*. In temperate North America there are 10 species, belonging to 8 genera, of which the most common is the Jack-in-the-pulpit, or Indian turnip, *Arisæma triphyllum*. The skunk-cabbage, *Spathyema fœtida*, and the sweet-flag, *Acorus calamus*, are also well-known representatives of the order. The tuberous roots of many species abound in starch, and furnish a wholesome food when cooked, or after the acridity has been removed by washing, as in the taro, *Caladium Colocasia*, which is extensively cultivated in tropical countries. British or Portland arrowroot is manufactured from the roots of *Arum maculatum* (the wake-robin or cuckoo-pint), the species of which are natives chiefly of tropical countries. A principle of acridity generally pervades the *Araceæ*, existing in so strong a degree in some as to render them dangerous poisons, as *Dieffenbachia seguina* of the West Indies and South America, which receives its popular name *dumb-cane* from the fact that when it is chewed the tongue becomes swelled by the acrid juice, and the power of speech is destroyed. Many species are cultivated in greenhouses, chiefly as foliage-plants, and

Arachis (ar′a-kis), *n.* [NL., < Gr. ἄραχος, ἄρακος, ἀρακίς, some leguminous plant.] A small genus of leguminous plants, natives of Brazil. The genus is remarkable in the order for its elongated pedicel-like calyx-tube, and for the manner in which the growing stipe of the ovary bends downward and, attaining a length of 2 or 3 inches, pushes the ovary into the ground, where it begins to enlarge and ripen. The best-known species is *A. hypogæa*, the common peanut or groundnut, which is now cultivated in most warm climates, and is esteemed a valuable article of food. Its pod when mature is oblong, often contracted in the middle, wrinkled, of a pale-yellow color, and contains two seeds of the size of a hazel-nut, sweet in flavor, especially when

(*a*) In Lamarck's and Latreille's systems of classification, one of three classes into which the Linnean *Insecta* were divided, the other two being *Crustacea* and *Insecta*; primarily divided into *Pulmonaria* and *Trachearia*. (*b*) In Latreille's system, the second class of articulated animals with articulated legs, apterous and ametabolous. It was divided into two orders, *Pulmonaria* and *Trachearia*, the former containing the spiders and scorpions, the latter the false scorpions, harvestmen, and mites. (*c*) A class of the phylum *Arthropoda*, including the spiders, scorpions, false scorpions, harvestmen, and mites, with or without the bear-animalcules and the *Pycnogonida* and *Pentastomida*. They are apterous, ametabolous, articulate animals, with articulated legs. They are decephalized by the blending of the head with the thorax as a cephalothorax, normally bearing 8 legs, and never more; the antennæ are transformed into chelæ when present; the abdomen is usually distinct but not segmented, or if segmented is not distinctly separated from the cephalothorax, and does not bear limbs, the appendages being in the higher forms transformed into spinnerets; the eyes are simple and generally more than two in number; the respiratory apparatus is pulmonary or tracheal, or compounded of these two forms; and their mode of progression is digitigrade. There are about 4,500 species, some of which are fossils occurring in the Silurian and Carboniferous. They are now divided into from six to nine orders. Huxley makes six: *Arthrogastra*, *Araneina*, *Acarina*, *Arctisca*, *Pycnogonida*, *Pentastomida*. Pascoe makes nine: *Scorpiodea*, *Cheliferidea*, *Acaridea*, *Araneidea*, *Phalangidea*, *Phrynidea*, *Solpugidea*, *Arctisca*, *Pentastomidea* (without *Pycnogonida*). Synonymous with *Acephala*, 3, and *Acera*, 2.

Numberless minute glands, provided with separate ducts, secrete the viscid material which hardens into silk when exposed to the air. The glands have been divided into five kinds: aciniform, ampullate, aggregate, tubuliform, and tuberous. Their ducts enter the arachnidial mammillæ, and discharge through orifices in the arachnidial papillæ.

II. *n.* **1.** A kind of fossil madrepore.—**2.** In *anat.*, the serous membrane enveloping the brain and spinal cord; the middle one of the three cerebrospinal meninges, between the dura mater and the pia mater. It was formerly regarded as consisting of two layers, a visceral layer investing the pia mater and a reflected parietal layer lining the dura mater, the two constituting a shut sac, like other serous membranes, inclosing a cavity called the arachnoid cavity, containing a serous fluid, the arachnoid fluid; but the more modern view regards the arachnoid membrane as a single sheet external to the pia mater and attached to it, but not following it into the sulci and other depressions of the brain. What was formerly called the cavity of the arachnoid is now termed the subdural space. The arachnoid is by some regarded as simply the outermost layer of the pia mater. Also called *arachnoid membrane*, *arachnoidea*, *arachnoides*, and *araneous membrane*.

The spiders breathe by two or more pulmonary sacs, combined or not with tracheæ. The abdomen is not segmented, and is distinctly separated from the cephalothorax; they have no antennæ, as such, but a pair of palps; they have from 2 to 8 simple eyes, and 8 legs of 7 joints each. The abdominal appendages are modified into an arachnidium or spinneret, the apparatus by which cobweb, gossamer, and other kinds of spider-silk are spun from a secretion of glandular organs. There are also always poison-glands connected with the mouth-parts. The division of the group varies with every leading writer as to number of suborders or families and their arrangement, some admitting but two or three families, others several suborders and upward of twenty families, while the diversities of detail are endless. A prime division is into *Dipneumones*, those having two pulmonary sacs (the great bulk of the order), and *Tetrapneumones*, with four; or according to the number of stigmata, those having two pairs (*Tetrasticta*) or only one pair (*Tristicta*); or according to the number of eyes, whether 2, 4, 6, or 8; or, finally, according to the way in which they move about and spin their webs. Some authors adopt three families: *Araneidæ*, *Lycosidæ*, and *Mygalidæ*. Also *Araneidea*, *Araneina*.

A crossbow used in Europe in the chase and in war throughout the middle ages. The bow was made of steel, horn, or other material, and was of such great strength and stiffness that some mechanical appliance was used to bend it and adjust the string to the notch. The lighter arbalists, used in the chase, and generally by horsemen, required a double hook, which the arbalister carried at his girdle. Heavier ones required a kind of lever, or a windlass, or a revolving winch with a ratchet and long handle, to draw them; these appliances were separate from the arbalist, and were carried slung from the shoulder or at the belt. The short and heavy arrow of the arbalist was called a *quarrel*, from its square head, or more commonly a *bolt*, as distinguished from the *shaft* discharged by the longbow. Sometimes stones (see *stone-bow*) and leaden balls were used. The missile of the arbalist was discharged with such force as to penetrate ordinary armor, and the weapon was considered so deadly as to be prohibited by a council of the church except in warfare against infidels. It could, however, be discharged only twice a minute. It was used especially in the attack and defense of fortified places. F. *arche*, an arch, fem. form (prob. by confusion with OF. and F. *arche*, ark, < L. *arca:* see *arch*[2]) of OF. and F. *arc*, < L. *arcus:* see *arc*[1].] **1**†. In *geom.*, any part of the circumference of a circle or other curve; an arc. See *arc*[1], 1.—**2.** In *arch.*, a structure built of separate and inelastic blocks, assembled on a curved line in such a way as to retain their position when the structure is supported extraneously only at its two extremities. The separate blocks which compose the arch are called *voussoirs* or *arch-stones*. The extreme or lowest voussoirs are termed *springers*, and the uppermost or central one, when a single stone occupies this position, is called the *keystone*. The under or concave face of the

assembled voussoirs is called the *intrados*, and the upper or convex face the *extrados*, of the arch. When the curves of the intrados and extrados are concentric or parallel, the arch is said to be *extradosed*. The supports which afford resting and resisting points to the arch are *piers* or *pillars*, which receive the vertical pressure of the arch, and *abutments*, which resist its lateral thrust, and which are properly portions of the wall or other structure above the springing and abreast of the shoulder of the arch. The upper part of the pier upon which the arch rests (technically, the point from which it springs) is the *impost*. The *span* of an arch is the distance between its opposite imposts. The *rise* of an arch is the height of the highest point of its intrados above the line of the imposts; this point is sometimes called the *under side of the crown*, the highest point of the extrados being the *crown*. The *thrust* of an arch is the pressure which it exerts outward. This pressure is practically collected, so far as it is manifested as an active force, at a point which cannot be exactly determined theoretically, but is at about one third of the height of the rise of the arch. The thrust must be counteracted by abutments or buttresses. Arches are designated in two ways: First, in a general manner, according to their properties, their uses, their position in a building, or their exclusive employment in a particular style of architecture. Thus,

there are *arches of equilibration*, *equipollent arches*, *arches of discharge*, *skew* and *reversed arches*, *Roman*, *Pointed*, and *Saracenic arches*. method used in describing the curve, as *equilateral*, *three-centered*, *four-centered*, *ogee*, etc. When an arch has one of its imposts higher than the other, it is said to be *ramp*. *Foil arches* are arches whose intrados outlines form a series of subordinate arcs called *foils*, the points of which

Such arches were first erected under

the Roman emperors, and were originally temporary structures, festooned and otherwise decorated, standing at the entrance of a city, or in a street, that a victorious general and his army might pass under them in triumph. At a later period the triumphal arch became a richly sculptured, massive, and permanent structure, having an archway passing through it, and often a smaller arch on either side. The name is at the present day often given to an arch, generally of wood decorated with flowers, evergreens, banners, etc., erected on the occasion of some public celebration or rejoicing. The great arch in a church which gives access to the choir—the chancel arch—is sometimes so called. In early Christian churches, a representation of the Glory or Triumph of Christ sometimes occupied a wall-space above this arch.

lithographica was imposed by Von Meyer. A second specimen from the same formation and locality was named *A. macrura* by Owen. The specific identity of the two can be neither affirmed nor denied, and their generic identity is only presumptive. A third and still more characteristic specimen is identical with the second, and has furnished many additional characters. Members of this genus had teeth, a long, lizard-like tail formed of many vertebræ, and separate metacarpal bones, in combination with a carinate sternum and other features of modern birds. It is thus a unique type of ornithic structure, and represents a distinct subclass of *Aves*. See *Saururæ*.

In *biol.*, having a primitive blastopore or original orifice of invagination of a blastosphere which has undergone gastrulation; retaining an archenteric aperture, as distinguished from any other which may be acquired by a deuterostomatous gastrula: it is the usual state of those gastrulæ which are formed by emboly.

In the former [process of gastrulation by emboly] the blastopore would be left as the aperture of communication of the endoderm with the exterior; and the result would be the formation of an *archæostomatous* gastrula.

The word is said to have been used by Basil Valentine, a German chemist of the fifteenth century, to denote the solar heat as the source of the life of plants. Paracelsus uses it with the above meaning. It is frequent in the writings of Van Helmont, who explains it as a material preëxistence of the human or animal form *in posse*. He regards the archæus as a fluid, that is, as a semi-material substance, like air, and seems to consider it a chemical constituent of the blood. Paracelsus had particularly made use of the hypothesis of the archæus to explain the assimilation of food. This function of the archæus became prominent in medicine. Van Helmont calls it the door-keeper of the stomach (*janitor stomachi*). There are further divarications of meaning. Also spelled *archeus*.

As for the many pretended intricacies in the instance of the efformation of Wasps out of the Carcase of a Horse, I say, the *Archei* that formed them are no parts of the Horse's Soul that is dead, but several distinct *Archei* that do as naturally joyn with the Matter of his body, so putrified and prepared, as the Crowes come to eat his flesh.
Dr. H. More, Antidote against Atheism, app. xi.

A person familiar with the dialect of certain portions of Massachusetts will not fail to recognize, in ordinary discourse, many words now noted in English vocabularies as *archaic*, the greater part of which were in common use about the time of the King James translation of the Bible. Shakspere stands less in need of a glossary to most New Englanders than to many a native of the Old Country.
Lowell, Biglow Papers, Int.

There is in the best *archaic* coin work [of the Greeks] . . . a strength and a delicacy which are often wanting in the fully developed art of a later age.

Greek Archaic Sculpture.
Funeral Relief, illustrating the careful but angular and "fluted" treatment of drapery.

The archaic, in *art*, not simply the quality of rudeness or of being primitive, but a rudeness and imperfection implying the promise of future advance. Work that is merely *barbarous* is not properly *archaic*. The archaic style, in an art of sufficient force to have any development, succeeds the first rude attempts of a people to arrive at graphic representation, and exhibits a manifest sincerity and striving to attain truth, until finally the archaic quality disappears little by little as truth is reached in the great art-schools, such as those of Greece and of the Renaissance painters, or as art sinks into lifeless conventionalism before reaching truth, as in the sculpture of Egypt and Mesopotamia.

The adoption or imitation of that which is antiquated or out of use; especially, the use of archaic words or forms of speech.—2. The quality of being archaic; antiquity of style, manner, or use, as in art or literature; especially, in *art*, the appearance of traces of the imperfect conception or unskilful handling of tools and material belonging to an art before the time of its highest development. See *the archaic*, under *archaic*.

3. That which is archaic; especially, an antiquated or obsolete word, expression, pronunciation, or idiom.

A permissible *archaism* is a word or phrase that has been supplanted by something less apt, but has not become unintelligible.

The word occurs in two passages of the Bible, 1 Thes. iv. 16, and Jude 9. Michael, mentioned in the latter as an archangel, also in Daniel as the spiritual prince of the Jews, and in Rev. xii. 7 as the leader of the heavenly hosts against the dragon and his angels, is the St. Michael of the church calendar. Coming after him in dignity, three others are especially known by name as archangels: Gabriel, the heavenly interpreter and annunciator or herald (Dan. viii. 16, ix. 21; Luke i. 19); Raphael, the guardian angel commemorated in the book of Tobit; and Uriel (2 Esd. iv. 1), the fire or light of God, often mentioned, like the others, in Milton's "Paradise Lost." Three other names are added by tradition to make the number seven (Tobit xii. 15, Rev. viii. 2, where the angels mentioned are taken as archangels), Chamuel, Jophiel or Zophiel, and Zadkiel; and still others are spoken of.

For *archangels* were the first and most glorious of the whole creation: they were the morning work of God, and had the first impressions of his image.
Dryden, Ded. of Plutarch's Lives.

The origin of the breed is unknown: it was introduced into England from Ghent. The name is supposed to allude to the brilliancy of the plumage. The bird breeds very true, the chief points being the peaked crest and the luster.

archangelic (ärk-an-jel′ik), *a.* [< ML. *archangelicus*, < LGr. *ἀρχαγγελικός*, < Gr. *ἀρχάγγελος*, archangel.] Of or pertaining to archangels: as, "*archangelic* pomps," *Mrs. Browning.*

archbishop (ärch′bish′up), *n.* [< ME. *archbishop*, *archebiscop*, etc., < AS. *arce-*, *ærce-*, *ercebiscop* (also *heáh-biscop*, lit. high bishop) = OFries. *arcebiskop* = D. *aartsbisschop* = OHG. *erzibiscof*, G. *erzbischof* = Icel. *erkibiskup* = Dan. Sw. *erkebiskop* = F. *archevêque* = Sp. *arzobispo* = Pg. *arcebispo* = It. *arcivescovo*, < LL. *archiepiscopus*, < LGr. *ἀρχιεπίσκοπος*, chief bishop, < Gr. *ἀρχι-*, chief, + *ἐπίσκοπος*, bishop: see *arch-* and *bishop.*] A title used in the Christian church as early as the fourth century, and regularly given in that and the next four centuries to the bishops of the highest rank, afterward known as patriarchs. It was also occasionally applied in the East to exarchs and metropolitans of sees of exceptional antiquity or dignity, and was sometimes extended in later times to others of the same rank as a special distinction. In the West, from the eighth or ninth century, the title was given to metropolitans of every class, and this is still the use of the Roman Catholic Church. Archbishops have certain rights of honor and jurisdiction over their suffragan bishops (that is, the bishops of the dioceses making up their ecclesiastical province), such as those of calling and presiding over provincial councils, receiving appeals in certain cases, etc.; but these rights, formerly very considerable, are now comparatively limited. At present the archbishop is not always a metropolitan, since there have long been a few archbishoprics without suffragans, and oftener still the title is purely honorary. See *primate.* The insignia of an archbishop in the Roman Catholic Church are the woolen pallium, before receiving which from the pope he cannot exercise the functions of his office, and the double cross borne processionally before him. In the Anglican Church there are four archbishops, two in the Church of England (those of Canterbury and York, the former of whom is metropolitan of all England), and two in the Church of Ireland (those of Armagh and Dublin, the former of whom is primate). The Church of Sweden has one archbishop, whose see is at Upsala. Abbreviated to *abp.*

The word is found as the title of an ecclesiastical dignitary from the fourth century. In the East it is last found as applied to an ecclesiastical officer of the court of Constantinople under the late Byzantine empire. In the West, from the eighth century, dioceses began to be divided into separate territories, over which rural archdeacons were placed, having under them deans or rural archpriests, charged with the supervision of the parish priests of their respective districts; over these was the general or grand archdeacon of the whole diocese, who took precedence of the archpriest (which see), and held his own court with its officials, distinct from that of the bishop, so that appeals were taken from the former to the latter. The rural archdeacons were often priests, having a cure of souls, as was also the grand archdeacon from the twelfth century. The powers and privileges of this office were gradually restricted, and in the Roman Catholic Church, since the Council of Trent, its place is for the most part supplied by the bishop's vicar-general, between whom and the parish priests are sometimes found the vicars forane, or present rural deans; while the archdeacon of the present day, where the office survives, holds a dignity of honor. In the Church of England each bishop has the assistance of two or more archdeacons, who as his deputies inspect and manage the affairs of the diocese, and perform a variety of duties partly secular and partly ecclesiastical. In two dioceses of the Protestant Episcopal Church of America the title *archdeacon* has been introduced.—**Archdeacon's court.** See *court.*

the form of an arch, usually to secure greater resistance or provide for a longer span than a straight beam would afford. The most important type of arched beam is that which is built up, often called a compound arched beam. Such beams are made in many forms, especially in those of several thicknesses of timber or planks laid upon or alongside of one another and bolted together, and of a truss construction in iron. [NL., < Gr. *ἀρχέγονος*, first of a race, original, < *ἀρχε-*, *ἀρχι-*, first (see *archi-*), + *γόνος*, race: see *-gony*.] The pistillidium or female organ of the higher cryptogams, having the same function as the pistil in flowering plants. It is a cellular sac, containing at the bottom a cell, analogous to the embryo-sac of phænogamous plants, which is impregnated by spermatozoöids from the male organ (antheridium). From this, after fertilization, the new plant is produced directly, as in the ferns and their allies, or a spore-case is developed, as in the mosses, when new plants follow upon the germination of the spores.

It includes man alone, and is conterminous with the order *Bimana* of some, or the family *Hominidæ* or *Anthropidæ* of others. All the cerebral characters adduced are shared by the anthropoid apes, and the term is not in use, except as a synonym of a group of the zoölogical value of a modern family.

In Greek art the archer is generally represented in Oriental dress and armor, and the use of the bow by a native Greek in war is rarely mentioned; but one of the two bowmen of the Ægina temple is dressed and armed as a Greek, and on a Basilicatan vase at Naples (Heydemann, No. 922), of good Greek work, a painting represents three youths, evidently Greeks, shooting with bows and arrows at a cock on a column. Among the Romans archers are rarely mentioned. Throughout the middle ages the archers formed an important part of the armies of Europe; but, as they were drawn wholly from the peasants and townspeople, the nobility and their retainers were often suspicious of them, and the free use of the bow among the common people was often discouraged. In some countries, too, the arbalist was so much preferred that the longbow came little into use. In England large bodies of archers were furnished by towns and counties to the royal armies, and were armed with some degree of uniformity with the steel cap, the gambeson or hauberk, and a short double-edged sword, besides bow and quiver. There is no record of mounted archers in the English armies, but they were common on the continent; the dukes of Burgundy maintained large bodies of them, and King Charles VII. of France had a body-guard of mounted men armed with brigantine or gambeson, and carrying a longbow. From this last organization the name *archers* came to be applied to the body-guard of one of the later kings of France, whose weapon was the harquebuse, which replaced the bow and shafts, and (until the Revolution) to the watchmen or guards of the French cities.

Archil is used for tinting the fluid employed in spirit-thermometers, while litmus is employed by chemists as a test for acidity or alkalinity.

In Russia the bishops are selected from among the archimandrites. The title has been retained among those who separated from the Eastern Church and submitted to the pope while still observing the Greek rite (the so-called United Greeks), and their monasteries are now subject to one proto-archimandrite. A congregation of Basilian monks existing in Sicily before the eleventh century has been under the care of an archimandrite apparently from that time. Its head abbey is that of San Salvatore in Messina, and it forms an exempt archimandritate immediately dependent on the pope. In the early church, and sometimes during the middle ages in the Western Church, the word was used vaguely as equivalent to *prelate*.

Archimedean (är″ki-mē'dē-an or -mē-dē'an), *a.* [< L. *Archimedēus*, < Gr. (*b*) The hydrostatical principle, also discovered by Archimedes, that a body immersed in a fluid loses an amount of weight equal to that of the fluid it displaces.—**Archimedean propeller**, a propeller consisting of a continuous spiral vane on a hollow core running lengthwise of the vessel. It is an amplification and extension of the screw.—**Archimedean railway**, a form of railway in which a continuous shaft rotates on pillars between the lines of rails, and propels the car by means of a screw which engages in a pedestal attached to the car.—**Archimedean screw**, a device for raising water, said to have been invented by Archimedes. It is made by forming a spiral tube within, or by winding a flexible tube spirally about, a cylinder. When the cylinder is placed in an inclined position, and the lower end is immersed in water, its revolution will cause the water to move upward through the spiral chambers. Whatever quantity of water first enters the screw immediately descends by its own weight to the lowest point of the spiral; but this point being always shifted higher up by the revolution of the screw, the water may thus be raised to a considerable height. Also called *water-screw* and *spiral pump*.—**Archimedean solid**, one of the thirteen solids described by Archimedes, which, without being regular, have all their solid angles alike, all their faces regular, and not less than four faces of any one kind: sometimes incorrectly called *semi-regular solids*. It was supposed by Gegenbaur to be most nearly approximated in nature by the pectoral member or fin of the ceratodontids, but this view has not been generally accepted; by others the pectoral member of a primitive selachian is believed to approximately realize the idea.

I have given the name of *Archipterygium* to the ground-form of the skeleton, which extends from the limb-bearing girdle into the free appendage.

The Archæologist cannot fail to remark how severe, in a true age of art, is the observance of this great *Architectonic* law—how its influence pervades all design—how the pictures on Greek vases, or the richly embossed and chased work of the mediæval goldsmiths, are all adjusted to the form and surface allotted to them by an external necessity.

architecture (är'ki-tek-tūr), *n.* [= F. *architecture* = It. *architettura*, < L. *architectura*, < *architectus*, architect: see *architect*. The Gr. word is *ἀρχιτεκτονία*, < *ἀρχιτέκτων*; also *ἀρχιτεκτονική*: see *architectonic*.] **1.** The art of building, specifically of fine or beautiful building. Architecture includes, in the widest sense, (1) the principles of design and of ornament as applied to building; (2) the science of construction, including the properties of materials and the methods of combining them; and (3) the practice of construction, including estimates of cost and the directing of builders and workmen. The practice of this art requires skill in design, which is the special province of the architect, and skill in execution, which is the special province of the workmen whom the architect employs and directs. It is the function of skill in architectural design to combine in a harmonious scheme the independent and often hostile requirements (1) of use

and convenience as dictated by the conditions of the problem in hand; (2) of constructive necessity and fitness as determined either by practical experience or by scientific theory; and (3) of artistic excellence both in the proportions of the parts and in the decorative treatment of details, in accordance with either the general principles and canons of good taste or the prescriptions of custom or tradition. It is the function of skill in execution practically to carry out the scheme so designed; and this skill is exercised by draftsmen, surveyors, mechanics, artisans, and artists, each in his place. Architecture is properly distinguished from mere building by the presence of the decorative or artistic element. The most important styles in the history of architecture are the Egyptian, Assyrian, Hellenic, Roman, Byzantine, Medieval (including Romanesque and Pointed), Renaissance, and Arabic. (See these and other adjectives characterizing architectural styles.) The various later medieval styles are commonly included under the vague and misleading term Gothic (which see).

Architecture, the art of building, includes two elements, theory and practice. The former comprehends the fine-art side proper, the body of general rules inspired by taste and based on tradition, and the science, which admits of demonstration by means of invariable and absolute formulas. Practice is the application of theory to particular needs; it is practice which causes the art and the science to conform to the nature of materials, to climate, to the customs of a period, or to the necessities of the occasion.

Viollet-le-Duc, Dict. de l'Architecture (trans.), I. 116.

We must consider *Architecture* as the great law which has in all time regulated the growth and affected the form of painting and sculpture, till they attain to a certain period in their development, and free themselves from its influence. *C. T. Newton*, Art and Archæol., p. 29.

After the abolition of the title of king in Attica there was chosen a single archon, who exercised for life essentially royal prerogatives. The term of office was afterward reduced to ten years, and in 683 B. C. it was made annual, and the duties of the archonship were distributed among nine persons. The first was the *archōn epōnymos* (name-giving archon), whose functions were executive and judicial, and whose name was given in official acts, etc., to the year of his service; the second was the *archōn basileus* (archon king), whose duties were chiefly religious and ceremonial; the third was the *archōn polemarchos* (archon generalissimo), who was, first in fact and then nominally, commander of the military power; and the remaining six were the *thesmothetæ*, or administrators of justice, whose most important duty it was to pass carefully in review, each year, the whole body of laws of the state, in order to make sure that no errors or contradictions had crept in, that repealed laws had been duly canceled, and that repetition was avoided. It rested with the thesmothetæ, also, to see that all the laws of the republic that were in vigor were strictly enforced, and to bring to trial any public official who had failed in his trust. At the end of their year of office, all the archons, unless they were found guilty of malfeasance, by virtue of their office entered the council of the Areopagus.

In various Gnostic systems, one of several spiritual powers superior to angels, believed to be the rulers of the several heavens. According to Basilides, the great archon is the highest cosmical power and the creator of the ogdoad or ethereal world, having below him the archon who created and rules the hebdomad or lower planetary heaven. T. high priest: see *archierey.*] *Eccles.*, the chief among the priests, called by the Greeks *protopresbyter*, and later *protopope.* As a title it dates from the fourth century, and was originally given to the senior by ordination in a diocese, a rule long strictly observed in the West. The archpriest or dean of the cathedral assisted the bishop in solemn functions and in his spiritual administration, though without ordinary jurisdiction; the rural archpriest or dean had a limited superintendence over the parish priests of his deanery or district of the diocese, and formed with them the rural chapter, as the bishop with his canons formed the cathedral chapter. For relations with other officials, see *archdeacon.* At present, in the Roman Catholic Church, *archpriest* is, for the most part, a title of honor only, the former duties of the office being performed by the auxiliary bishop or the dean of the cathedral chapter. The duties of the rural archpriests, since the Council of Trent, have commonly devolved on the vicars forane, still sometimes called rural deans, or directly on the bishop's vicar-general. The family includes several genera and about 75 species, of most parts of the world, inhabiting seas, lakes, marshes, and rivers, nesting usually in communities in trees and bushes, where they perch with ease by means of their insessorial feet, laying greenish whole-colored eggs, and rearing their young in the nest. They are divisible into three subfamilies: *Ardeinæ*, the true herons; *Botaurinæ*, the bitterns; and *Cancrominæ*, the boatbills. The last-named, however, is often considered a family apart. A rocky hill in Athens, situated immediately to the west of the Acropolis; hence, the sovereign tribunal or council of elders which held its sittings on this hill from unrecorded antiquity. Though modified several times in its constitution, notably by Solon and Ephialtes, the Areopagus always retained the highest reputation for dignity, justice, and wisdom. Its functions were at once religious, political, and judicial; the scope of its action was thus much wider than that of a supreme court of the present day, extending not only to jurisdiction in cases of homicide and some others in which religion was concerned, and to a general censorship of all affairs of state, but even to the supervision of education, and to certain police and sumptuary regulations. In historic times the Areopagus was constituted of all archons, after their year of office, who had successfully proved themselves guiltless of malfeasance, in accordance with the provisions of law.

They are still used, especially in France, as the common names of these six notes. Since the intervals between these notes are the same as those between the first six tones of the modern major scale, the syllables have also been used extensively as names for those tones and as guides in studying their relations. It was first recognized in 1895 by Lord Rayleigh and Professor W. Ramsay, who separated it from the nitrogen with which it had till then been confounded largely because of its chemical inertness, it being more indifferent to reagents than even that element. It has a boiling-point of —186.1° C., and in the solid state melts at —189.5° C. It yields two characteristic spectra, marked respectively by certain prominent red and blue lines.

=Syn. *Argue*, *Dispute*, *Debate*, *Discuss*, plead, expostulate, remonstrate. To *argue* is to defend one's opinion, or to exhibit reasons or proofs in favor of some assertion or principle; it implies a process of detailed proof by one or more persons. To *dispute* may be to call in question the statements or arguments of an opposing party: as, to *dispute* about an award. It often means the alternate giving of reasons, especially by two persons. It is often applied to mere bickering, and is in general less dignified than the other words. To *debate* is to interchange arguments in a somewhat formal manner, as in debating societies and legislative bodies. To *discuss* is, by derivation, to shake or knock a subject to pieces in order to find the truth, or the best thing to be done. A *debate*, therefore, may be viewed as a *discussion*, or a *discussion* as a *debate*. Strictly, a *discussion* is an amicable presentation of opinions, not limited, like the others, to affirmative and negative sides of a proposition, and with the expectation on the part of all that the conclusion will be the adoption of no one person's opinion or plan unmodified. To *argue* a point, to *dispute* a position, to *dispute* with a neighbor, to *debate* a motion, to *discuss* a subject or a plan.

These fish-lice have a flat shield-like body, the cephalothorax coalesced with the abdomen, and the postabdomen rudimentary and bearing two tail-fins. argument (är'gū-ment), *n.* [< ME. *argument*, < OF. *argument* (F. *argument*), < L. *argumentum*, proof, evidence, token, subject, contents, < *arguere*, prove, argue: see *argue*.] 1. A statement or fact tending to produce belief concerning a matter in doubt; a premise or premises set forth in order to prove an assumption or conclusion.

When virtue cannot safely be advanced.

Thicker than *arguments*, temptations throng.

Pope, Essay on Man, ii. 75.

The only *argument* available with an east wind is to put on your overcoat. *Lowell*, Democracy.

[This, the familiar meaning of the word, probably originated in Roman law-courts. The usual definition given by Cicero and almost all authorities is *ratio rei dubiæ faciens fidem*, a reason causing belief of a doubtful matter. Boëtius in one place defines it as a medium proving a conclusion. The word *medium* here means a premise, or premises, according to all the commentators. (*Petrus Hisp.*, tr. v. ad init.) But since *medium* usually means the middle term of a syllogism, some logicians have been led to give *argument* this signification.]

2. The middle term of a syllogism. [See preceding note.]

Argument is the bare proof or mean term which is invented by him that disputeth, to prove the truth of the question; but argumentation is the whole reasoning itself, of what form soever it be, comprehending both the question and also the proof thereof. *Blundeville*, 1619.

Argument again, *argumentum*,—what is assumed in order to argue something,—is properly the middle notion in a reasoning—that through which the conclusion is established. *Sir W. Hamilton.*

3. A reasoning; the process by which the connection between that which is or is supposed to be admitted and that which is doubted or supposed to need confirmation is traced or tested.

In matters of wrong *arguments* do confound sense, when in explanation of right they do sensibly approve it.

Ford, Honour Triumphant, ii.

The probability which she easily perceives in things thus in their native state would be quite lost if this *argument* were managed learnedly and proposed in mood and figure. *Locke.*

We do not know God by *argument*, by reading books of evidences or books of theology: we know him just as we know the external world,—by experience.

J. F. Clarke, Self-Culture, p. 162.

The remembrance of this small vexation
Will be an *argument* of mirth for ever.

8. In *math.*: (*a*) Of a complex number, the coefficient of the imaginary unit in its logarithm. (*b*) The angle or quantity on which a series of numbers in a numerical table depends and with which the table is entered. If, for example, a table of the sun's declination were formed corresponding to every degree, etc., of longitude, so that, the longitude being known, the declination might be found opposite to it, then the longitude would be called the *argument* of the table. Tables of double entry have two arguments. In the Ptolemaic astronomy, the *argument*, without qualification, is the angular distance on the epicycle of a planet from the true apogee of the epicycle; and the *equation of the argument* is the angular distance, as seen from the earth, of a planet from the center of the epicycle, the correction to the second inequality. See *equation*.—**Argument from enumeration**, a rude kind of induction in which the inference is made that something is true of a whole class, because it is true of certain members of that class.—**Argument from example.** See *example*.—**Argument from exclusion**, an argument in which, after showing that all causes but one are insufficient to account for a phenomenon, it is urged that the one remaining cause must be the true one.—**Argument of the latitude**, the arc of the orbit reckoned from the ascending node.—**Artificial argument, contentious argument, cumulative argument.** See the adjectives.—**Dilemmatic argument**, one which purports to show that a whole class has a certain character by dividing it into parts, and showing that every part has that character.—**Disjunctive argument**, a reasoning of the form: S is either P or Q; it is not P; hence it must be Q.—**Dissentaneous argument, extrinsic argument**, etc. See the adjectives.—**Hypothetical argument**, an argument one of whose premises is a hypothetical or conditional proposition. It is not identical with *hypothetic inference*. See *hypothetic*.—**Inductive argument**, an argument founded on an induction.—**Negative argument**, an argument which concludes the non-existence of a phenomenon from its not having been observed. (For other phrases, see *argumentum*, *place*, *proof*.)=Syn. 3. *Plea*, *Argument*. "*Plea* should be used of the pleadings or of the arraignment before the trial, not of the *argument* at the trial. A *plea* is always addressed to the court; an *argument* may be addressed either to the court or to the jury." *A. S. Hill*, Rhetoric, p. 53.

Ἀρίων, a celebrated cithara-player, said to have been rescued from drowning by a dolphin.] A genus of pulmonate gastropods, by some referred to the family *Limacidæ* and subfamily *Arioninæ*, but now generally considered as the type of a family *Arionidæ*, including several species of slugs, of which *A. ater*, the black slug, is a characteristic example.

In the principal genus, *Arion*, there is a triangular pore at the upper posterior part of the body, which readily separates it from Limax. *Stand. Nat. Hist.*, I. 319.

arionid (a-rī'ọn-id), *n.* A gastropod of the family *Arionidæ*.

Arionidæ (ar-i-on'i-dē), *n. pl.* [NL., < *Arion* + *-idæ*.] A family of geophilous pulmonate gastropods, resembling the *Limacidæ*, and represented by such genera as *Arion* and *Ariolimax*. Its technical characters are a shell reduced to a small flat plate or granules, a small and shield-like anterior mantle, the jaw entire and transversely ribbed, and teeth of three kinds, the laterals especially differing from those of the *Limacidæ* by their low, wide, and quadrate form. They are confounded with the limacids under the general name of slugs.

Arioninæ (ar″i-ō-nī'nē), *n. pl.* [NL., < *Arion* + *-inæ*.] The slugs of the genus *Arion* and related genera, such as *Ariolimax*, regarded as a subfamily of the *Limacidæ*.

The Limacidæ are divisible into three subfamilies. In the *Arioninæ* the shell may be present, though concealed by the mantle, or it may be represented by a number of calcareous grains scattered through the corresponding portion of the mantle. *Stand. Nat. Hist.*, I. 318.

ariose (ar-i-ōs'), *a.* [< It. *arioso*, q. v.] Characterized by melody, as distinguished from harmony. [Rare.]

arioso (ȧ-rē-ō'sō), *a.* [It., < *aria*, air: see *aria* and *air*[3].] In *music*, like an air, as contradistinguished from *recitative*. The word is used especially with reference to recitative passages which are treated more in the smooth and melodious style of airs than in the ordinary style of recitatives. In instrumental music it indicates a flowing vocal style. Prefixed to an air, it denotes a sustained elaborate style, appropriate to the great airs of an opera.

-arious. [Accom. of L. *-arius*: see *-ary*[1] and *-ous*.] A suffix of Latin origin, another form of *-ary*[1], but used only in adjectives, as in *adversarious*, *arenarious*, *calcarious* (now erroneously *calcareous*), *gregarious*, *vicarious*, etc.

The literal meanings, however, or those which seem literal, have become more associated with *rise*, and the consciously figurative with *arise*: as, he *rose* from his chair; the sun *rose*; the provinces *rose* in revolt; trouble *arose*; "Music *arose* with its voluptuous swell," *Byron*, Childe Harold, iii. 21.

There are about 180 species, of which 11 occur in the United States. They are remarkable for their curious flowers, which vary greatly in form and size, but are all so constructed as to imprison in some way the insects which visit them. The relative position of the anthers and stigmas prevents fertilization without the agency of insects, and self-fertilization even by their aid is, at least in some cases, made impossible by proterogyny. The flowers are usually of a dingy hue.

Dutchman's-Pipe (*Aristolochia Sipho* [*macrophylla*]).

A. Goldieana, of Calabar, has the largest that are yet known, the blade of which is nearly 2 feet in breadth. In *A. Clematitis* insects bringing pollen to the early matured stigma are imprisoned by impeding hairs which wither after the fresh pollen is shed. This and some other European species had formerly a reputation as emmenagogues and as facilitating parturition. Various species have had a popular reputation as remedies for snake-bites, as anthelmintics, etc., and the Virginia snake-root, or serpentary-root, *A. Serpentaria*, is employed as a stimulating tonic and diaphoretic. The pipe-vine, or Dutchman's-pipe, *A. Sipho*, a native of the Alleghanies, with very large cordate leaves, is cultivated as an ornamental climber.

C.), the father of logic and the most influential of all philosophers, or to his works, school, or philosophy. See *peripatetic*.—**Aristotelian logic.** (*a*) The logic of Aristotle, especially in the modified form taught in the middle ages. (*b*) Formal logic, based on the four propositional forms: All S is P; No S is P; Some S is P; Some S is not P.—**Aristotelian sorites**, a progressive chain of reasoning like the following: He who is prudent is temperate; he who is temperate is constant; he who is constant is unperturbed; he who is unperturbed is without sorrow; he who is without sorrow is happy; therefore, the prudent man is happy.

The progressive *sorites* has been called the common or *Aristotelian*. This latter denomination is an error, for Aristotle, though certainly not ignorant of the process of reasoning now called sorites, does not enter upon its consideration. *Sir W. Hamilton.*

II. *n.* A follower of Aristotle. See *peripatetic*.

Aristotelianism (ar″is-tō-tē′li-an-izm), *n.* [< *Aristotelian* + *-ism*.] The philosophy of Aristotle, or any later modification of it. Aristotelianism is a kind of metaphysical evolutionism. Its central idea is the distinction of *act* and *power* (actuality and potentiality). The nature of the world as a whole, as well as every part of it, may be illustrated by the analogy of the growth of a tree from a seed. The tree has a sort of being in the seed—a potential being: it exists in it in *power* only. That which is actualized in the perfected development from the seed—the tree—exists in *act* or actuality. This perfected development—the entelechy—is the characteristic nature of the thing which places it in some natural species, and which is its *form*, or that element of the thing which makes it to be the kind of thing that it is. The other element, which merely makes the thing to be, is its *matter*, which, as unformed, is identified by Aristotle with the *power* or potentiality of a germ. Every event is an act of development. Most events take place under the influence of an external efficient cause, and their character is determined by an end. *Matter*, *form*, *efficient cause*, and *end* are the four Aristotelian causes or principles. But not all events are brought about by external efficient causes. Some happen by fortuitous spontaneity, and are not determined by any causes whatever. Other events come to pass naturally, that is, by a self-determined growth. Besides that which is moved but does not cause motion, and that which is both moved and causes motion, there must needs be a *tertium quid*, which is not moved, yet causes motion; and this is God, or *pure act* (actuality) without undeveloped potentiality. The soul is the entelechy, or perfect flower, of the body. It has three parts, the vegetative (or merely vital), the sensible, and the rational. The reason is not a mere belonging of the individual; it exists before the body, and, as the active reason, is common to all persons upon the tablets of whose passive reason it writes its dicta. Space and time are mere logical elements of motion. Aristotle is justly called the father of logic, although there were some vague logical doctrines before him, and although his system is now largely superseded. He holds the only excellent reasoning to be syllogism, and all other kinds of reasoning to be imperfect approximations to syllogism. Particular facts are first and best known to us, but general truths are first and best known in themselves. Science must set out with certain fixed first principles, which are definitions. Knowledge is a development from impressions of sense, to the formation of which reason and experience both contribute. Things are of ten classes, substances, relations, quantities, qualities, etc. See *category*. Different genera are subdivided upon different principles, so that there are no cross-divisions in the real classification of natures. It is possible to so collate passages from Aristotle as to make him appear as an inductive logician; but the whole cast of his mind was such as to lead him to underrate the importance of induction. He lays much stress on the principle of excluded middle, which he treats as a corollary of the principle of contradiction; and he has a general leaning to hard and rather wooden distinctions. The most important of his ethical doctrines are that happiness lies in the working out of one's inwardness, and that every virtue is a golden mean between two vices.

	Arithmetical.	Geometrical.
First pair,	2.5	2.449490
Second "	2.474745	2.474615
Third "	2.474680	2.474680

The numbers of the last pair being sensibly equal, 2.474680 is the arithmetico-geometrical mean of 2 and 3. This process, invented by Gauss, is useful in calculating elliptic integrals.

In that of Thomas of Colmar the multiplicand, or dividend, is set up on figure-wheels by mechanical devices. A description in heraldic terms of shield, crest, etc., is called *blazoning* (which see). The right to bear the arms of the father is inherited by the sons, but in strictness each of the younger sons should add to the paternal shield a label as a mark of cadency; the same right descends to a daughter only if she is her father's heiress. A person inheriting an estate other than the paternal one often assumes the arms of the former possessor, but should in strictness apply to the proper authorities. See *king-at-arms, herald,* and *heralds' college.* Arms not paternal may be classed as follows: (*a*) *Arms of dominion,* or the national arms borne by the sovereign, in which generally the bearings inherited by the prince as an individual have come to have a certain national character. (*b*) *Arms of community,* as of a corporation, an episcopal see, or the like. Arms assumed by a republic, as by the United States or by one of the States, partake of the nature of both the preceding. (*c*) *Arms of pretension,* as, specifically, those assumed by a sovereign in assertion of his claim to a realm not actually under his authority, like the fleurs-de-lys of France, which were borne by English sovereigns until 1801. (*d*) *Arms of succession,* denoting inheritance of an estate, as mentioned above. (*e*) *Arms of assumption,* or *assumptive arms,* bearings assumed or granted in consequence of an exploit, as the three feathers with the motto *Ich dien* taken from the slain King John of Bohemia by Edward the Black Prince at the battle of Crécy (1346), and now borne by the Prince of Wales. (*f*) *Arms of alliance,* as where one spouse impales the arms of the other on his or her shield. (*g*) *Arms of office,* arms which are the perquisite or appendage of some public position. In all the above cases except (*a*) and (*b*), a private individual having a right to such arms charges them with the paternal arms, whether by quartering or otherwise. For the origin and history of arms, see *heraldry.*—**Abated arms.** See *abate.*—**Adoptive arms.** See *adoptive.*—**Allusive arms,** in *her.*, a bearing or bearings having immediate reference to the wearer's name: thus, the arms of a person named Lamb or Herring would be termed *allusive,* if they included as a bearing a figure of the animal so named. In this way the name De Loupe may have been given to the first earls of Chester because of their bearing a wolf's head, or the name Arundel may be derived from swallows (French *hirondelles*) borne on the shield. The arms of Bolton are a crossbow-bolt driven through a tun. Castile and Leon had for their chief bearings a castle and a lion respectively. There are many such cases. Also called *allusive heraldry, canting heraldry, rebus,* and *armes parlantes.*—**Arms-carrying Act.** See *Bill of Rights,* under *bill.*—**Arms of precision, firearms rifled,** furnished with graduated sights, accurately prepared bullets, and appliances calculated to enable them to act with precision and rapidity, and at much greater distances than ordinary weapons. The Springfield and Mauser magazine-rifles are examples.—**Assize of arms.** See *assize.*—**Assumptive arms.** See above, 7 (*e*), and *assumptive.*—**Coat of arms.** See *coat.*—**Places of arms,** in *fort.*, parts of the covered way opposite the salient and reëntering angles of the counterscarp.—**Repeating arms,** arms that can be discharged a number of times without being reloaded.—**Rifled small arms,** rifles, muskets, carbines, pistols, or revolvers, the bores of which are cut with spiral grooves or "rifles."—**Small arms,** all weapons not requiring carriages, as opposed to *artillery,* and including rifles, muskets, bayonets, pistols, revolvers, sabers, and swords; also, sporting weapons.—**Stand of arms,** a complete set of arms for one soldier, consisting of a musket, bayonet, cartridge-box, and belt, with or without a sword.—**To arms!** a warning equivalent to "arm! take to your arms; make ready for battle." (Compare *alarm.*)—**To bear arms,** to do military service; serve as a soldier.

ML. *armadillus*, a kind of sea-fish.] **1.** An American edentate quadruped, of the order *Bruta* (or *Edentata*) and suborder *Loricata*, and of the extant families *Tatusiidæ*, *Dasypodidæ*, and *Chlamydophoridæ*, or of the extinct family *Glyptodontidæ*, having a hard shell or carapace like a coat of mail, resulting from a peculiar ossification of the integument and the confluence of numerous small scutes.

Armadillo, or Peludo (*Dasypus villosus*).

In the glyptodons the carapace was entire and fixed, and even in some cases covered the belly as well as the back; but in all the living armadillos the shell is divided into an anterior, a posterior, and an entire or variously divided middle part. When the division of the middle part is complete, the animal can roll itself into a ball. The teeth are numerous, but vary in number and other characteristics with the several genera; in the genus *Prionodontes* they are a hundred in number. The peba is an armadillo of the family *Tatusiidæ*, the *Tatusia novemcincta*, the only one of the group found as far north as the United States. There are other species. The encouberts are the typical armadillos of the family *Dasypodidæ*. The peludo is *Dasypus villosus*. The kabassous constitute the genus *Xenurus*. The kabalassou is *Priodontes gigas*. The apars are the three-banded armadillos, of the genus *Tolypeutes*. The pichiciagos constitute the family *Chlamydophoridæ*; they are the smallest and most peculiar forms, being less than a foot long, while the kabalassou is three feet long without the tail. All these animals are mild, timid, and inoffensive, subsisting on roots, leaves, and fruits, sometimes on insects or flesh. They are able to dig into the ground with great rapidity, and escape from their enemies in this way as well as by rolling up in a ball. The flesh is considered good for food.

2. In *Crustacea*: (*a*) [*cap.*] A genus of isopods, of the family *Oniscidæ*, including the pill-bugs, which can roll themselves into a ball like the mammals called armadillos. (*b*) A species of this genus; a pill-bug or sow-bug; a kind of wood-louse.—**3.** A name given to an electric battery composed of copper and zinc elements riveted together, and designed to be worn as a remedy in certain diseases.

It was necessary for him . . . to proceed with his twenty men-of-war to the Mediterranean, while his superiors, with the rest of the *armament*, returned to the Channel.
Macaulay, Hist. Eng., xx.

2. Munitions of war. Especially, the guns in permanent fortifications on the sea-coast, or, the number and caliber, or weight, of all the guns which a ship of war carries. Within a comparatively short period remarkable changes have occurred in the size and weight of the armament of war-vessels. In the United States, before the civil war, the usual armament for both forts and vessels consisted of 32-pounders. The war led to the construction and use of 15-inch smooth-bore guns, weighing 50,000 pounds, and afterward of 20-inch guns, weighing 100,000 pounds. Rifling was introduced in 1859, and is now universally employed, reliance being placed upon the piercing power of elongated projectiles moving at a great velocity and fired from rifled guns. The United States battle-ship New York carries ten 14-inch and twenty-one 5-inch guns. In the British navy, the Warrior, in 1861, was provided with 4½-ton guns; but the weight of metal was successively increased up to the 111-ton guns of the Sans Pareil (1887). The British King George V. and three sister battle-ships (Centurion, Ajax, and Audacious) carry a main armament of ten 13.5-inch guns. The German Oldenburg is armed with ten 12.2-inch and fourteen 6-inch guns. The more recent ships of other nations have similar armaments. See ★*battle-ship*.

The typical plan of such churches maintains a strict symmetry between the apsidal and western ends, having antiparabemata to correspond with the parabemata, and omitting the narthex. The central dome is often represented by a lofty tower.—**Armenian blue.** See *blue*.—**Armenian bole.** See *bole*[2].—**Armenian cement,** a cement made by soaking isinglass in water until it becomes soft, and then mixing it with spirit in which a little gum mastic and ammoniacum have been dissolved. It is used to unite pieces of broken glass, to repair precious stones, and to cement them to watch-cases and other ornaments.—**Armenian Church,** the ancient national church of Armenia. It maintains that it was founded as early as A. D. 34; but while traces of Christianity are found previously to the fourth century, the conversion of the country as a whole was the work of St. Gregory the Illuminator, who began his evangelistic labors about the year 301; and from his name it is sometimes known also as the Gregorian Church. The Armenian Church has for the most part remained estranged from the orthodox Greek Church since the latter part of the fifth century, when it rejected the decrees of the Council of Chalcedon (A. D. 451). It has therefore been credited

with holding Monophysite or Eutychian doctrine, but many authorities hold that the differences arose from misunderstandings occasioned by the incapacity of the Armenian language to express the finer distinctions of Greek terminology. The Armenian Church accepts all the first seven ecumenical councils, with the exception of that of Chalcedon, the doctrines of which they seem, however, to hold under a different phraseology. Their doctrines and usages closely resemble those of the Greek Church, with the exception of their use of unleavened bread and of an unmixed chalice in the eucharist. The priesthood is hereditary. The bishops are governed by four patriarchs, the primate being the catholicos, who resides in the monastery of Etchmiadzin, a short distance north of Mount Ararat. Since the fifteenth century a large number of the Armenians have joined the Roman Catholic Church and are known as *United Armenians*. A separate Armenian Protestant Church has also recently been formed.—**Armenian era,** **liturgy,** etc. See the nouns.—**Armenian stone,** a soft blue carbonate of copper; also, a commercial name for lapis-lazuli.

It fitted the head well, allowed of some movement, and had openings for sight and breathing. It was forged in many parts, which fitted together accurately and were secured by hinges, hooks, and the like, and when closed was very rigid and firm.

The whole revolves upon its axis within a horizon divided into degrees and movable in every direction upon a brass supporter. There are two kinds of armillary sphere, one with the earth and one with the sun in the center, called respectively the sphere of Ptolemy and the sphere of Copernicus. Since the main use of such a contrivance is to give an accurate representation of the apparent motions of the solar system, the former is the one most used, the latter having little practical value.

Arminian (är-min′i-an), *n.* and *a.* [< NL. *Arminianus*, < *Arminius*, Latinized from the name of *Harmensen*.] **I.** *n.* **1.** One of a Christian sect named from James Arminius (Jacobus Harmensen), a Protestant divine of Leyden, Netherlands (1560–1609). Its members were also called *Remonstrants*, from a statement of their views in the form of a remonstrance presented to the States-General in 1610. They separated from the Calvinists, objecting to their doctrine of predestination. The sect as a distinct organization is chiefly confined to the Netherlands, where it numbers only about twenty congregations and a few thousand adherents.

2. A believer in the Arminian doctrines. These doctrines are: (1) Conditional election and reprobation, in opposition to absolute predestination as taught by

Calvin. (2) Universal redemption, or that the atonement was made by Christ for all mankind, though none but believers can be partakers of its benefits. (3) That man, in order to exercise true faith, must be regenerated and renewed by the operation of the Holy Spirit, which is the gift of God. (4) That this grace is not irresistible. (5) That believers are able by the aid of the Holy Spirit to resist sin, but that there is always in this life the possibility of a fall from grace, in opposition to the Calvinistic doctrine of the perseverance of the saints. Protestants in general shared in the controversy excited by the promulgation of these doctrines, and all opponents of Calvinism are still often characterized as Arminians. In the Church of England Arminianism was especially favored by the High Church party. The Methodist denomination was divided on the subject, the followers of Wesley being Arminians, and those of Whitefield Calvinists.

> But, while an *armistice* is an interval in war and supposes a return to it, a peace is a return to a state of amity and intercourse, implying no intention to recommence hostilities. armor, armour (är′mor), *n.* [Second form now usual in England; < ME. *armour, armowre*, earlier and more commonly *armure*, armor (often in pl. *armures, armurs, armeris, armeres*, weapons), < OF. *armure, armeüre*, F. *armure* = Sp. Pg. *armadura* = It. *armadura, armatura*, armor, < L. *armatura*, armor: see *armature.*] 1. Defensive arms; any covering worn to protect the person against offensive weapons. All available materials that offer some resistance to edge or point have, at various epochs and among various peoples, been put to use for this purpose, as thick skins, garments of linen or of silk, stuffed with vegetable fiber, or made of many thicknesses of material, thin plates of horn or metal, sewed to some textile fabric and lapping over one another like scales, etc. Usually the headpiece was the first piece of armor to be made in solid metal. (See *helmet.*) The Greeks had a solid cuirass from a very early period. (See *cuirass* and *thorax.*) This, with the helmet and the greaves (see *greave*), constituted the whole armor of the heavy-armed Greek warrior of historic times. The Roman legionary was in general similarly armed, sometimes wearing only one greave. Chain-mail was introduced in the armor of the Roman soldiery. The Norman invaders of England in 1066 wore a conical helmet with a nasal or strong projecting piece of iron coming down over the nose, and long gowns of stuff to which were sewed rings or plates of metal, and the leaders had leg-coverings of similar make. A century later chain-mail was in common use. The knights of the time of Richard I. of England (Cœur de Lion, 1189–1199) wore a long hauberk of chain-mail, reaching to the knee or below, with long sleeves closed at the ends so as to form gloves, and with openings in the sides through which the hands could be passed, leaving the gloves hanging down from the wrist; hose of the same make, either covering the feet or worn with shoes of strong leather; or sometimes long hose of leather laced or buckled like modern long gaiters. A hood, called the camail, sometimes of chain-mail, sometimes of leather, covered the head and descended to the shoulders, and upon this rested the iron helmet, either of conical form or rounded or acorn-shaped, without vizor, pressing on the head at its lower edge, where it was often secured to the camail, and rising above the crown of the head. Very rarely in this reign a closed helmet was used, as seen on a seal of King Richard I.; helmets of this form became common early in the reign of Henry III. (1216–1272). By the time of Henry IV. (1399–1413) and his invasion of France (1411), the knight was completely clothed in armor of plates, chain-mail being used at the junction of the limbs with the body, at the elbow- and knee-joints, and for a hood covering the top of the corselet. Finally, under Henry VI. (1422–1461), at about the time that the English were driven out of France (1453), the suit of armor reached its complete development, being forged of thin steel to fit the body and limbs, weighing not over 60 or 70 pounds in all, and allowing of free movement. This, however, was extremely costly. The armor worn in jousts and tournaments was very different after the twelfth century from that worn in war, being heavier, and neither allowing the knight to dismount without assistance nor affording him adequate protection if dismounted. For war, in spite of the general adoption of firearms, armor, though not investing the whole body, continued to be worn by officers and mounted men until the close of the seventeenth century, in the wars of Louis XIV.'s reign, and, indeed, survives to this day in the helmets and cuirasses of certain corps of cavalry. (The cuts are from Viollet-le-Duc's "Dict. du Mobilier français.")

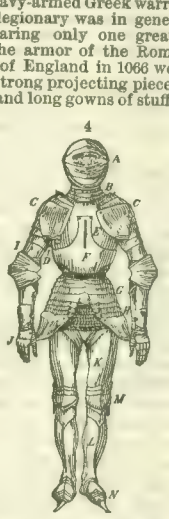
Complete Armor of 1195–1205.

1. Conical helmet set upon the hood. *A*, hood of leather; *B*, camail of chain-mail secured to the hood. This is here separate from the hauberk, though it was often a part of it. The hauberk of mail reaches to the knees and is divided before and behind; the gambeson has a long skirt, and is worn under the hauberk and divided in the same way; the belt is only a leather strap with buckle; the shield is triangular and very much rounded or bowed sidewise, and straight lengthwise; the hose, or chausses, are of mail, and the shoes of leather. The broigne was often worn instead of the hauberk; the closed helmet, rarely. The chausses often covered the feet, replacing the shoes.



Armor and Equipment for man and horse, about 1290.

2. A heaume or large helmet, worn over a steel cap (mortier or secret). It had no vizor nor aventaile, but was worn only in fight, and rested directly upon the armor of the neck. *A*, ailette (one on each shoulder); *B*, rerebrace; *C*, cubitière, or elbow-guard; *D*, genouillière, or knee-guard; *E*, greave, or bainberg; *F*, surcoat of stuff worn over the armor; *M*, barbs of the same make as the body-armor of the rider; *N*, chamfron of hammered iron; *O*, housings of stuff affording considerable protection. The armor of the body and limbs of the rider is of the fashion called banded mail; that for the body, therefore, is not properly a hauberk, perhaps a broigne.

Complete Armor, about 1395.

3. *A*, basinet with vizor; *B*, large camail of chain-mail; *C*, corselet of separate plates of iron or steel, each one riveted to an inner doublet or jacket of linen, silk, or leather (this corselet comes no higher than the armpits, and corresponds exactly to the later pansière); *D*, complete brassart; *E*, cubitière, which is, however, included in *D*; *F*, gauntlet of leather with bracelet or wrist-guard of steel, and back of hand covered with a steel plate; *G*, skirt of six taces or tassets sliding one over another like the shell of a lobster's tail (each tasset is riveted to a series of vertical straps of stuff or leather); *H*, military belt secured to the lowest tasset (the sword is not secured to the belt, but to a hook or staple riveted to the cuishe); *I*, cuishe, or thigh-piece, in two parts connected by hinges and fastened by hooks; *J*, jamb, or leg-piece, in two parts like the cuishe; *K*, genouillière, or knee-guard; *L*, solleret of small plates sliding one over another.

Complete suit of Plate-Armor, now in Paris, date about 1440—the epoch of greatest perfection of defensive arms.

4. *A*, armet; *B*, gorget of three plates or splints sliding one over the other, the lowermost one passing beneath the plastron; *C*, *C*, pauldrons, each of three sliding plates, the right-hand pauldron smaller than the left, and its lowest plate capable of being lifted to allow the lance to be put in rest; *D*, adjustable lance-rest; *E*, plastron, or upper part of corselet; *F*, pansière, or lower part of corselet (these two pieces slide one upon the other so that the body can bend forward, and the pansière is so cut away over the hips that the body can bend sidewise); *G*, skirt of taces or tassets; *H*, other tassets forming thigh-guards (the large lowest splint is often called the tuille); *I*, complete brassart in many pieces perfectly articulated and forming a connected sleeve, composed of rerebrace, vambrace, and cubitière; *J*, gauntlet having no bracelet, but secured to vambrace of brassart; *K*, cuishe; *L*, jamb; *M*, genouillière, having two sliding splints above the main knee-guard; *N*, solleret, with the terminal splint removable when the wearer dismounted.

In Europe the cables contain from five to seven wires, each insulated with gutta-percha, and the whole protected with an *armor* of iron wires or iron pipe.
Greer, Dict. of Electricity, p. 162.

4. In *magnetism*, same as *armature*, 6. [Rare.] —**Mascled armor.** See *mascled.*—**Submarine armor**, a water-tight covering worn by a diver; a diving-dress. The essential part of the armor is a metal helmet, large enough to permit free movement of the head within, provided with windows for outlook, and connected with a breastplate which prevents any compression of the lungs. The remainder of the suit is of india-rubber. Pure air is pumped through a tube opening into the helmet and is projected against the windows, removing the moisture which condenses upon them; it then becomes diffused and is breathed, the impure air passing out through a similar tube. Weights are attached to the waist, and leaden soles to the shoes. A signal-line affords communication with attendants above.

armor-plate (är'mor-plāt), *n.* A metallic plate, usually of iron or steel, intended to be attached to the side of a ship or the outer wall of a fort, with the view of rendering it shot-proof. A protection of iron for ships was proposed in the early part of the present century, but the first practical application of it was probably to the French floating batteries used in the Crimean war. The success of these led the French to construct "La Gloire," the first of the so-called ironclads, completed in 1861. This vessel, which had 4-inch wrought-iron plates over a backing of about 3 feet in thickness, was speedily followed in 1861 by the "Warrior" and other ships of the same class built by the British government, with 4½-inch plates over 18 inches of teak backing. Both the thickness and the resisting power of the armor have been increased as more powerful ordnance has been invented. So-called "compound armor-plates" were early adopted, consisting of a hard steel face welded upon a soft iron back. This proving to be too brittle, better results were obtained by oil-tempering the face of a homogeneous steel plate. The most notable advances, however, in the manufacture of armor-plate have been due to the use of nickel-steel, and the invention of the process of face-hardening known as *harveyizing* (which see). The Krupp process is a modification of the Harvey process, by means of which carbon is made to penetrate deeper below the surface, thus giving greater resistance when hardened. In recent British ships the thickness of the main armor-belt is 12 inches. In the United States navy the maximum thickness varies in the monitors from 10 to 18 inches, and in the latest battle-ships (as the New York and the Texas) it is 11 inches at the water-line, the improvements in the plates rendering it possible to make them thinner and to protect a greater area on the side of the vessel. See *ironclad*.

armor-shelf (är'mor-shelf), *n.* An iron shelf or ledge projecting from the sides of an armored war-vessel, and forming a support upon which the armor-plate and armor-backing rest.

Pride hath no other glass

Shak., T. and C., iii. 3.

=**Syn.** *Pride, Arrogance, Presumption, Assumption, Haughtiness, Disdain, Loftiness, Superciliousness, Insolence,* lordliness, self-importance, imperiousness, swagger. (See *pride.*) *Pride* and *disdain* are the only words in the list that may have a good meaning when applied to per-

sons: as, *pride* in one's country; *disdain* of a base suggestion. *Pride* primarily respects the temper of the mind, not being necessarily manifested or directed toward others; it is the general term for an unreasonable estimate of one's own superiority in any respect. As it comes into relation and action, it may receive other titles. Thus, *arrogance* is, at its simplest, *pride* with contempt of others, and is essentially the same as *disdain*. In action, *arrogance* is the assertion of exorbitant claims to rank, dignity, estimation, homage, power, etc. *Presumption* is often used for *arrogance*, but more properly expresses a self-conceited and self-important forwardness to run risks, take liberties, and crowd in where one does not deserve to be. *Presumption* helps itself to what it wants, while *arrogance* claims from others, and feeds its *pride* by seeing them yield. *Presumption* is less selfish than *arrogance*, but more conceited and headstrong. *Assumption* has added to its other meanings a bad sense, kindred to *presumption*; it means a disposition to do what does not belong to one to do, and sometimes to claim to be more than one is. *Haughtiness*, like *disdain* and *loftiness*, dwells upon the inferiority of others quite as much as upon its own elevation; it is equally applicable to spirit and to manner. *Disdain* is a mingling of lofty contempt with aversion, abhorrence, or indignation. *Superciliousness*, as befits its derivation, is chiefly applied to manner; it is a manifested haughtiness. *Insolence* is exhibited not only in manner, but in conduct and language; it is pride or haughtiness, shown in contemptuous or overbearing treatment of others, especially by words; from an equal or an inferior it is an outrageous kind of impertinence. See *impudence*, *egotism*, and *scorn*.

I know you proud to bear your name,
Your *pride* is yet no mate for mine,
Too proud to care from whence I came.
Tennyson, Lady Clara Vere de Vere.

Turbulent, discontented men of quality, in proportion as they are puffed up with personal *pride* and *arrogance*, generally despise their own order. *Burke*, Rev. in France.

The *loftiness* of man shall be bowed down. Isa. ii. 17.

Sometimes, it is true, the giraffe stoops to mammalian levels; but there is something so lofty even in its condescension that the very act of bending enhances the *haughtiness* of its erect posture, and suggests that it does it from policy. The *insolence* of the aggressor is usually proportioned to the tameness of the sufferer. *Ames*, Works, II. 96.

A slender, generally pointed, missile weapon made to be shot from a bow. Arrows have nearly universally been made with a light, straight shaft of wood, fitted with feathers at the nock-end to steady the flight, and with a pointed head of various forms, often barbed so as to remain fixed in the object pierced. Those used in the middle ages rarely had barbed heads; sometimes the head was flat, sometimes conical, and fitted to the shaft like the ferrule of a walking-stick. The arrow-heads of the North American Indians were of flint, obsidian, or other hard stone, or of bone, as well as of metal, and were often barbed. They were secured to the shaft by lashings of hide or sinew. Arrow-heads intended to be poisoned, as among South American Indians, are said to be fastened lightly, so as to leave the shaft and remain in the wound. The feathers at the butt of the shaft seem to have been generally used in all ages, and are so set, or are of such a form, as to give to the arrow a rotary movement, like that of a rifle-ball. The arrow of the crossbow is called a *bolt* or *quarrel* (which see).

Other starches than that of *Maranta* are occasionally sold under the name of arrowroot. *Brazilian arrowroot*, or tapioca-meal, more usually known as *cassava*, is obtained from the fleshy root of *Manihot Manihot*, after the poisonous juice has been removed; *East Indian arrowroot*, from the large root-stocks of *Curcuma angustifolia*; *Chinese arrowroot*, from the creeping rhizomes of *Nelumbo Nelumbo*; *English arrowroot*, from the potato; *Portland arrowroot*, from the corms of *Arum maculatum*; and *Oswego arrowroot*, from Indian corn.

The name is said to refer to the powerful qualities of arsenic.] **I.** *n.* **1**†. A yellow mineral, called specifically *yellow arsenic;* the trisulphid of the element to which it has given its name; orpiment. [The original use.]—**2.** Chemical symbol, As; atomic weight, 75. A chemical element having a grayish-white color, a metallic luster, and a specific gravity of 5.727. Under ordinary pressure it does not melt, but at 450° C. it passes from the solid state into vapor of a lemon-yellow color. It tarnishes rapidly in moist air at ordinary temperature, and heated in air is oxidized to arsenic trioxid, As_2O_3. Arsenic occurs in nature uncombined, but much more commonly in combination. The chief ores are the two sulphids, realgar (As_2S_2) and orpiment (As_2S_3), arsenical pyrites or mispickel (FeSAs), and arsenides of iron, nickel, and cobalt. Most of the arsenic of commerce is prepared in Bohemia and Saxony or in England. Arsenic itself is little used in the arts. Its salts, however, have great commercial importance. With oxygen arsenic forms two compounds, the more important of which is arsenic trioxid (As_2O_3), a violent poison, the ratsbane, white arsenic, or simple arsenic of the shops. It is prepared by a process of sublimation from arsenical ores, and is sold as a white crystalline powder or in glassy translucent masses, which are odorless, nearly tasteless, and slightly soluble in water. The most reliable antidote is freshly prepared hydrated sesquioxid of iron, which should be given in considerable quantity after the stomach has been freed from the poison as completely as possible by an emetic given with bland liquids, such as milk, flour and water, or white of egg and water, which serve to envelop the poison and effect its complete ejection from the stomach. In the absence of hydrated sesquioxid of iron, large quantities of a paste made of chalk or magnesia and castor-oil may be used. Arsenic trioxid is used in medicine, especially in the treatment of certain nervous and skin diseases, and in the arts as the basis for preparing arsenical salts and certain pigments, and largely in the manufacture of glass. Arsenic has two oxygen acids, whose salts are the arseniates and arsenites. Free arsenious acid is not known. Arsenic acid occurs in commerce as a thick acid liquid, and is largely used in the manufacture of aniline red, and sodium arseniate is much used in calico-printing. Arsenic disulphid (As_2S_2) occurs native as realgar (see *realgar*), and is made artificially under the name of *ruby sulphur*. Both the native and the artificially prepared sulphids are used as pigments, as is also arsenic trisulphid (As_2S_3), or orpiment, also called *king's yellow.* **3.** The popular name of arsenic trioxid (As_2O_3), the preparation of arsenic usually retailed in trade. (*b*) In prevalent modern usage, that part of a foot which bears the ictus or metrical accent, as opposed to the metrically unaccented part, called the *thesis.* According to the original Greek usage, *arsis* denoted the raising of the foot in dancing, or of the hand in beating time, and therefore the unaccented part of the metrical foot, and *thesis* the fall of the foot or of the hand in dancing or beating time, and therefore the accented part of the prosodial foot. Latin writers show great confusion in the application of these terms, sometimes employing them in conformity with Greek usage, sometimes interchanging their meaning, sometimes assigning still other meanings to them. Some modern writers have employed them with their original Greek significations, as given above under (*a*); but the meanings given under (*b*), and believed to be supported by the Latin writers, are those generally adopted at the present time. **2.** In *physiol. acoustics*, a periodical increase in the intensity of a sound, producing a rhythmical effect.

Middleton, Father Hubbard's Tales.

With each gift of nature and of *art*.
Pope, Moral Essays, i. 192.

Mr. Mill says, "*Art* is but the employment of the powers of nature for an end." Yes; but the employment is the *art*. That use or employment of the natural elements is precisely the function of the intelligence and the will, which differs from nature, in its proper sense, as the active differs from the passive. *Edinburgh Rev.*

2. Skill; dexterity; an especial facility in performing any operation, intellectual or physical, acquired by experience or study; knack.

The object of science is knowledge; the objects of *art* are works. In *art*, truth is the means to an end; in science, it is only the end. Hence the practical *arts* are not to be classed among the sciences. *Whewell.*

Theorists, by an observation of particulars and by generalizing on them, attempt to construct a system of scientific propositions with respect to a certain subject; upon which system a set of rules intended for the guidance of practice may be founded. These rules form an *art*.
Sir G. C. Lewis, Authority in Matters of Opinion, iii.

5. [It. *arte*.] An organized body of men practising a given trade, and carrying out an established system of rules and traditions; a guild.

The city [Florence] was first divided into *arts*, in the time of Charles I. . . . These *arts* or companies . . . were at first but twelve, but afterwards they were increased to twenty-one, and arrived at such power and authority that in a few years they wholly engrossed the government of the city. . . . Seven of them were called the greater *arts*, and fourteen the less.
J. Adams, Works, V. 54.

A portion of the taxes was assigned to the work [building the Duomo, 1331], and the charge of it was committed to the *Art* of Wool; that is, to the corporation of the dealers in wool, the richest and most powerful of the *Arts* of Florence.
C. E. Norton, Church-building in Middle Ages, p. 211.

6. A branch of learning regarded as an instrument of thought, or as something the knowledge of which is to be acquired in order to be applied or practised: chiefly in the plural, and in such phrases as master of *arts*, faculty of *arts*, etc. Formerly in the universities the seven *liberal arts* were the Roman trivium, grammar, logic, and rhetoric, and the Pythagorean quadrivium, arithmetic, music, geometry, and astronomy. But by *art*, in the middle ages, was usually meant logic, that being the principal study in the faculty of arts.

Art is simply the harmonic expression of human emotion. *New Princeton Rev.*, II. 29.

8. Artistic or esthetic quality; the exhibition of the power of perceiving the beautiful and of expressing it in artistic forms: as, a picture skilfully painted, but devoid of *art*.—**9.** The actual production or construction of objects beautiful in form, color, or sound; the practical application of esthetic principles, as in the departments of production specifically called the *fine arts* (which see, below); especially, painting and sculpture.

Nothing is better founded than the famous aphorism of rhetoricians, that the perfection of *art* consists in concealing *art*. *Campbell.*

Art and part, in *Scots law*, instigation; abetment.

By *art* is understood the mandate, instigation, or advice that may have been given towards committing the crime; *part* expresses the share that one takes to himself in it by the aid or assistance which he gives the criminal in the execution of it. *Erskine.*

Bachelor of Arts. See *bachelor*.—**Black art,** necromancy; sorcery; the fancied power of performing wonderful feats by preternatural means, especially means derived from the assistance of the powers of evil: opposed to *white art* or *white magic*, that is, innocent magic. [*Black art* is a kind of translation of Middle Latin *nigromantia*, magic, a corruption, due to confusion with Latin *niger*, black (see *negro*), of *necromantia*, from the Greek νεκρομαντεία, necromancy. The confusion was assisted by the common practice of painting the devil black.]—**Decorative art,** that branch of art which has for its primary object merely the pleasure of the eye, especially in decoration which is subservient to architectural features or to form, as in ceramics.—**Faculty of arts,** the lowest and fundamental faculty of the four in the old universities; the faculty of philosophy, which had charge of students upon their first entrance and until they took the degree of master of arts. When a boy could read, write, and had mastered the elements of Latin grammar, he was considered ready to begin his studies in logic at the university. The instruction in the faculty of arts was sharply separated from the tests preliminary to the conferring of degrees. In the middle ages the subjects of the ordinary lectures were Priscian's grammar, the Isagoge of Porphyry, Aristotle's Organon, and the De Divisione and three books of the Topics of Boëtius, while the extraordinary lectures related to rhetoric, ethics, and a little geometry and astronomy. Frequent disputations constituted the only exercises for the scholars; and the masters disputed in public once a week. The degrees conferred at the recommendation of the faculty of arts were those of bachelor and master. In Paris the degree of licentiate was a distinct one intermediate between the others. The baccalaureate or determinance was not originally a degree. Upon the reform of the universities in the sixteenth century logic gave place to the humanities, and during the present century natural science has had a more considerable place in the instruction.—**Fine arts,** those arts which seek expression through beautiful modes; specifically, architecture, sculpture, painting, and engraving.—**Hermetic art.** See *hermetic*.—**Master of Arts.** See *master*.—**Military art.** See *military, a.*—**Plastic art** or **arts,** sculpture, including all subordinate or related arts by which objects are represented in the round or in relief.—**Work of art,** anything in the formation or into the accomplishment of which art in any sense has entered; specifically, a production of any one of the fine arts, but especially of one of the imitative members of the group, as a statue or a painting.

That is best which lieth nearest;
Shape from that thy *work of art*.
Longfellow, Gaspar Becerra.

=**Syn. 2.** Aptitude, readiness, address, tact, adroitness, contrivance.—**3.** Shrewdness, subtlety, cunning, artifice, deceit, duplicity.—**4.** *Art, Science.* The essential difference between an *art* and a *science* is in aim. "*Science* and *art* may be said to be investigations of truth, but *science* inquires for the sake of knowledge, *art* for the sake of production." (*Karslake.*) Hence, they differ somewhat in that with which they are concerned. "An *art* directly and immediately concerns itself with a faculty. . . . It fastens upon that, and keeps it ever in its view as it teaches how that may be developed, trained, and guided. A *science*, on the other hand, regards rather the product of [a] faculty, and, keeping its view directly upon that, proceeds to unfold its nature and proper characteristics." (*H. N. Day*, Art of Discourse, § 1.) Incidental to this difference is a difference in method, *science* being analytic and critical, while *art* is synthetic and constructive. In the matter which makes up the body of the two, an *art* involves the means of discipline in the use of the knowledge which may have been furnished by a corresponding *science*. The same branch of knowledge may be regarded as either a *science* or an *art*. It may be viewed theoretically, as seeking, coördinating, arranging, and systematizing knowledge, and by observation, comparison, abstraction, and generalization deducing laws; or as, with more or less reference to such preparatory work, framing rules which are the lessons of experience, and are designed to facilitate work or give it superior excellence. The more complete the scientific basis of an art, the more perfect the art. There is a secondary use of the word *science* by which it stands for an art that thus rests upon a science, as in the following:

The fundamental conception of the occupation of the architect embraces the two ideas of *science* and *art*. Architecture as an *art* is the work of the skilled hand; as a *science*, it is that of the informed and cultivated brain.

authority over the moon, which belonged more particularly to her kinswomen Hecate and Selene. 2. One of a system of cylindrical, membranous, elastic, and muscular vessels or tubes, which convey the blood from the heart to all parts of the body by ramifications which as they proceed diminish in size and increase in number, and terminate in minute capillaries which unite the ends of the arteries with the beginnings of the veins. There are two principal arteries: the *aorta*, which rises from the left ventricle of the heart and ramifies through the whole body, and the *pulmonary artery*, which conveys venous blood from the right ventricle to the lungs, to undergo arterialization. Most arteries are composed of three coats: an outer or fibrous, of condensed connective tissue well supplied with blood-vessels and nerves; a middle or elastic, consisting chiefly of circular, non-striated, muscular fibers; and an inner, thin, smooth, and dense, composed, from without inward, of an elastic fenestrated membrane, a layer of connective tissue, and a lining of endothelium. The outer coat is the (*tunica*) *adventitia*; the middle, the (*tunica*) *media*; the inner, the (*tunica*) *intima*. The arteries in the human body which have received special names are about 350 in number. They range in caliber from more than the thickness of a finger to microscopic dimensions.

In an artesian well proper the water rises to the surface and overflows. The geological conditions permitting this are not general, since it is necessary that the region should have a more or less complete basin-structure, and that there should be a series of permeable covered by impermeable beds. In the United States any deep bored well is called *artesian*, even if the water has to be pumped from a considerable depth. Artesian wells vary in depth from less than 100 to nearly 4,000 feet, some of the deepest borings being for petroleum.

10†. The number 10, or any number ending in a cipher.—**11.** In *gram.*, a word used attributively to limit the application of a noun to one individual or set of individuals, and also to indicate whether the noun used signifies indefinitely one or any one of the class which it names, or definitely a specific object of thought. The two articles are regarded as a distinct part of speech. They are in English *an* (before consonant-sounds *a*) and *the*. *An* was originally the same word as *one*, and in meaning is an unemphatic *any;* it singles out an individual as an example of a class, any other member of the class being capable of serving as example equally well. *A* or *an* is accordingly called the *indefinite article*. *The* was originally a demonstrative pronoun, and in meaning is an unemphatic *this* or *that;* it points out a particular individual or set of individuals, and is consequently known as the *definite article*. Articles may therefore be regarded as a specialized and segregated class of pronouns. Some languages, as Latin, have no articles; others, as Hebrew and Greek, have the definite article only. The indefinite article is always of later formation than the definite. [The name *article* is a translation of the word ἄρθρον, joint, which was applied by the Greek grammarians to the one article of that language (the definite), on account of its frequent use after the manner of a relative to join an adjective to a noun: as, ἀνὴρ ὁ ἀγαθός, literally, man *the* good, for (the) man who (is) good, that is, the good man.]—**Articles of association,** or **articles of incorporation,** the certificate filed, in conformity with a general law, by persons who desire to become a corporation, and setting forth the rules and conditions upon which the association or corporation is founded.—**Articles of Confederation.** See *confederation*.—**Articles of faith,** the main or essential points of religious belief; specifically, an authoritative and binding statement of such points as held by a particular church or denomination; a doctrinal creed.—**Articles of impeachment,** the accusations in writing which form the basis of an impeachment trial. They take the place of the *indictment* in ordinary criminal, and of the *declaration* or *complaint* in civil, actions.—**Articles of Perth,** five articles agreed upon at a General Assembly of the Church of Scotland convened by James VI. in 1618, enjoining certain episcopal observances, such as the observance of feast-days, kneeling at the Lord's supper, etc. They were ratified by the Scotch Parliament in 1621, and became a subject of bitter controversy between the king and the people.—**Articles of the peace,** an obligation to keep the peace for a certain time, under a penalty, and with or without sureties, imposed upon an individual against whom some one has exhibited a complaint that there is just cause to fear that the party complained of will burn the complainant's house or do him some bodily harm, or procure a third person to do it.—**Articles of Schmalkald,** articles of Protestant faith drawn up by Luther, and submitted to a meeting of electors, princes, and states at Schmalkald (or Schmalkalden), Germany, in 1537, designed to show how far the Protestants were willing to go in order to avoid a rupture with Rome.—**Articles of war,** a code of regulations for the government and discipline of the army and navy. In Great Britain they are embodied in the Mutiny Act, which is passed every year. The articles of war of the United States are 128 in number; anything relating to the army not comprehended therein is published in general orders or in established regulations, issued from time to time by the War Department, copies of which are furnished and read to the troops.—**City article.** See *city*.—**In the article of,** in the matter of; as regards.

See *lord*.—**Marriage articles.** See *marriage*.—**Memorandum articles.** See *memorandum*.—**The Five Articles and the Five Points,** statements of the distinctive doctrines of the Arminians and Calvinists respectively, the former promulgated in 1610 in opposition to the restrictive principles of the latter, which were sustained by the Synod of Dort in 1619, and are the following: particular predestination, limited atonement, natural inability, irresistible grace, and the perseverance of saints. The discussion of these differences at that time is sometimes called the *quinquarticular controversy*.—**The Lambeth Articles,** nine articles drawn up in 1595 at Lambeth, England, intended to embody the Calvinistic doctrine respecting predestination, justification, etc. They were never approved by the church in any regular synod, and therefore possess no ecclesiastical authority.—**The Six Articles,** sometimes called the "whip with six strings," articles imposed by a statute (often called the Bloody Statute) passed in 1539, in the reign of Henry VIII. They decreed the acknowledgment of transubstantiation, the sufficiency of communion in one kind, the obligation of vows of chastity, the propriety of private masses, celibacy of the clergy, and auricular confession. Acceptance of these six doctrines was made obligatory on all persons under the severest penalties. The act, however, was relaxed in 1544, and repealed by the Parliament of 1549.—**The Thirty-nine Articles,** a statement of the particular points of doctrine, thirty-nine in number, maintained by the Church of England, first framed by an ecclesiastical commission in forty-two articles (1552), and revised and promulgated in thirty-nine articles by a convocation held in London in 1562–63. With some alterations they were adopted by the Church of Ireland in 1635, and by the Scottish Episcopal Church in 1804, and, with certain modifications, by the Protestant Episcopal Church of the United States in 1801.—**The Twenty-five Articles,** the doctrinal basis of the Methodist Episcopal Church, substantially the Thirty-nine Articles of the Church of England, with the omission of the 3d, 8th, 13th, 15th, 17th, 18th, 20th, 21st, 23d, 26th, 29th, 33d, 34th, and 37th. They were originally framed by John Wesley, and, with some modification, were adopted, substantially as now held, in 1784.

★**Articulata** (är-tik-ū-lā'tä), *n. pl.* [NL., neut. pl. of L. *articulatus*, jointed: see *articulate*.] In *zoöl.*, a name variously applied. (*a*) In Cuvier's system of classification, the third prime division of the animal kingdom, including all segmented invertebrates in which the body is made up of a series of rings (metameres), is endowed with a ganglionated nervous system, and possesses distinct respiratory organs. It is divided into five classes, *Crustacea*, *Arachnida*, *Insecta*, *Myriapoda*, and *Annelides*. This division corresponds to the *Annulosa* of some zoölogists, but neither of these terms is now recognized by leading naturalists. Cuvier's first four classes of *Articulata* are now made the phylum *Arthropoda*, while his *Annelides* are referred to another phylum, *Vermes*. (*b*) One of two orders of *Brachiopoda*, sometimes styled the *Arthropomata* (which see), the other order being called *Inarticulata*. It corresponds to the arthropomatous *Brachiopoda*, containing those brachiopods in which the shell is hinged, the mantle-lobes are not entirely free, and the intestine is cæcal. articulate (är-tik'ū-lāt), *a.* and *n.* [< L. *articulatus*, jointed, distinct (applied particularly to utterance), pp. of *articulare:* see *articulate*, *v.*] **I.** *a.* **1.** Jointed; segmented; articulated: as, an *articulate* limb; an *articulate* animal.—**2.** Specifically, having the character of the *Articulata*.—**3.** Jointed by syllabic division; divided into distinct successive parts, like joints, by the alternation of opener and closer sounds, or the intervention of consonantal utterances (sometimes also of pause or hiatus) between vowel sounds: said of human speech-utterance, as distinguished from other sounds made by

human organs, and from the sounds made by the lower animals. The terms *articulate, articulation*, etc., as applied to human utterance, are not seldom misunderstood and wrongly used as if the "jointing" intended were that of the physical organs of utterance, a narrowing or closing of the organs at some point or points. Such action, however, belongs to all utterance, articulate or inarticulate, whether of man or of the other animals. See *consonant, syllable, vowel.*

(*b*) The uttering of articulate sounds.—**2.** In a concrete sense: (*a*) In *anat.*, a joint, as the joining or juncture of bones or of the movable segments of an arthropod. The articulations of bones are of three kinds: (1) *Diarthrosis*, or a movable connection with a synovial cavity, including enarthrosis, or the ball-and-socket joint; arthrodia, or the gliding joint; ginglymus, or the hinge-joint; the trochoid, or the wheel-and-axle joint, otherwise called *diarthrosis rotatorius;* and the condyloid, or saddle-joint. =**Syn.** *Artifice, Manœuver, Stratagem, Wile, Trick, Ruse, Finesse*, device, contrivance, cunning, craft, deception, cheat, fraud, guile, imposition, dodge, subterfuge, double-dealing. These words generally imply a careful endeavor to compass an end by deceiving others, not necessarily, however, with evil intent. They all imply management and address. An *artifice* is prepared with art or care; it is craftily devised. *Manœuver* suggests something more elaborate or intricate, a carefully contrived movement or course of action for a definite purpose; it is the quiet or secret marshaling of one's intellectual or other resources to carry a point. *Stratagem* is, like *manœuver*, a figurative term drawn from war; it is upon a larger scale what *wile* is upon a smaller, a device to deceive one who is the object of an imagined warfare, so that we may catch him at a disadvantage and discomfit him, or, more generally, a carefully prepared plan to carry one's point with another—to capture it or him, so to speak. A *wile* may be peculiarly coaxing or insinuating. *Trick* is the lowest and most dishonorable of these words; it may be a low or underhand act, in violation of honor or propriety, for the purpose of cheating, or something as bad. A *ruse* is a deception of some elaborateness, intended to cover one's intentions, help one to escape from a predicament, etc.; it is a plausible way of bringing about what we desire to happen, without apparent interference on our part. *Finesse* is subtlety in action; it is a more delicate sort of *artifice.* See *artful, evasion*, and *fraud.*

It contains those murine rodents which (except *Evotomys*) have the following characters: perennially growing, prismatic, rootless molars, with flat crowns and serrate periphery; incisors usually broader transversely than in the opposite direction; the root of the under incisor sometimes causing a protuberance on the inner side of the mandibular ramus between the condyloid process and the strong hamulate angle of the mandible, which latter attains the level of the molar crowns; the zygomata high and wide, not dipping to the level of the arched palate, and the nasal bones not produced beyond the premaxillaries; and the dental formula of 16 teeth, there being 1 incisor and 3 molars on each side of each jaw, without any canines or premolars. The *Arvicolinæ* are specially characteristic of the northern hemisphere, and are very abundant in high latitudes. They include all kinds of voles or field-mice properly so called, the water-rat of Europe, the meadow-mice of America, the lemmings, the muskrat, etc. The leading genera are: *Evotomys* (Coues), *Arvicola* (Lacépède) with its several subdivisions, *Synaptomys* (Baird), *Myodes* (Pallas), *Cuniculus* (Wagler), and *Fiber* (Cuvier). Aryan (är'yan or ar'iạn), *a.* and *n.* [Also written *Arian*, after L. *Ariānus*, belonging to *Ariana* or *Aria*, Gr. Ἀρεία, Ἀρία, or Ἄρια, the eastern part of ancient Persia, < Skt. *Árya*, the name by which the Sanskrit-speaking immigrants into India called themselves, in distinction from the aborigines of the country, whom they called *Dasyu*, *Śūdra*, etc. The ancient Persians gave themselves the same title (OPers. *Ariya*, Zend *Airya*); and it appears in the name of their country, *Airyana* or *Irān*: see *Iranic*. There are no traces of the word to be found outside of these two languages. Its origin is obscure and disputed; not prob. that it has anything to do with a root **ar*, plow.] **I.** *a.* Of or pertaining to the Aryans or to their speech. See II.

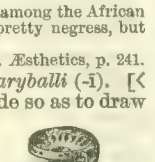
II. *n.* **1.** A member of the eastern or Asiatic division of the Indo-European family, occupying the territories between Mesopotamia and the Bay of Bengal, in the two subdivisions of Persia, or Iran, and India. [This is the older, more scientific, and still widely current use of the word. More recent, but increasingly popular, is the second use.]

2. An Indo-European or Indo-German or Japhetite; a member of that section of the human race which includes the Hindus and Iranians (Persians) as its eastern or Asiatic division, and the Greeks, Italians, Celts, Slavonians, and Germans or Teutons as its western or European division. The languages of all these branches or groups of peoples are akin; that is to say, they are descendants of one original tongue, once spoken in a limited locality by a single community, but where or when it is impossible to say.



Many words still live in India and England that have witnessed the first separation of the northern and southern *Aryans*, and these are witnesses not to be shaken by any cross-examination. The terms for God, for house, for father, mother, son, daughter, for dog and cow, for heart and tears, for axe and tree, identical in all the Indo-European idioms, are like the watchwords of soldiers. We challenge the seeming stranger; and whether he answer with the lips of a Greek, a German, or an Indian, we recognize him as one of ourselves. There was a time when the ancestors of the Celts, the Germans, the Slavonians, the Greeks and Italians, the Persians and Hindus, were living together beneath the same roof, separate from the ancestors of the Semitic and Turanian races. *Max Müller*.

Aryandic (är-yan'dik), *a.* Originating with Aryandes, Persian satrap of Egypt, condemned to death by Darius for coining silver finer than that of the great king himself.—**Aryandic coin**, a coin struck by Aryandes.

European artists who have not lived among the African race sometimes try their hands at a pretty negress, but they always *Aryanize* the type.
G. Allen, Physiol. Æsthetics, p. 241.

aryballus (ar-i-bal'us), *n.*; pl. *aryballi* (-ī). [< Gr. ἀρύβαλλος, a bag or purse made so as to draw close, a vessel so shaped.] In *archæol.*, a form of Greek vase. Probably in ancient times this name was applied to a large vase with a small neck, used for carrying water to the bath. In modern archæological nomenclature, it generally denotes a small vase shaped like a ball, with a short neck and a small orifice surrounded by a broad flat rim, used like the alabastrum in anointing the body with oil.

as[1] (az), *adv.*, *conj.*, and *pron.* [< ME. *as*, *ase*, *als*, *alse*, *also*, *alsa*, *alswa*, *al so*, *al swa*, < AS. *alswā*, *ealswā*, *eal swā* (= OS. *alsō* = OFries. *as*, *ase*, *asa*, *als*, *alse*, *alsa* = D. *als* = OHG. *alsō*, MHG. *alsō*, *alse*, G. *alsō*, *als*), lit. 'all so,' wholly so, quite so, just so, being the demonstrative adv. *so*, qualified by the intensive adv. *all*. As a demonstrative, the word retains its full form (see *also*); as a relative or correlative, the word, through weakening of force and accent, has been reduced to *as*. *As* is thus historically *so* with an absorbed intensive, whose force has disappeared; and it has all the relational uses of *so*, the differences being only idiomatical. The peculiar form and uses of *as* have arisen out of the correlation *so* . . . *so* (AS. *swā* . . . *swā*, or, without separation, *swā swā*), in which both terms were orig. demonstrative. The second term passed into the relative use, and the first, remaining demonstrative, was strengthened by the adv. *all* (AS. *eal swā* . . . *swā*). The second term, as a relative, became weak in accent, and, after assuming the prefix *all* in conformity to the first, was gradually reduced, through *also*, *alse*, *als*, *ase*, to *as*, to which, in turn, the first term in many constructions conformed. The resulting correlations *so* . . . *so*, *so* . . . *as*, *as* . . . *so*, *as* . . . *as*, through involution of uses, transposition of clauses, and ellipsis of one or the other term, extending often to the whole clause, present in mod. E. a complication of constructions which cannot be fully exhibited except at great length, and in connection with the earlier uses. They are also involved with the kindred correlations *such* . . . *as* (*such* being historically *so*, with an absorbed relational suffix) and *same* . . . *as*, in which the relative conj. *as* varies with *that*, and leads to the use of *as* as a simple relative pronoun.]

I. *adv.* (*demonstrative* or *antecedent*). The antecedent in the correlation *as* . . . *so*, or *as* . . . *as*: In that degree; to that extent; so far. The correlation *as* . . . *so* is obsolete; *as* . . . *as* is in extremely common use, being, besides *like*, the regular formula of comparison to express likeness or equality: as, *as* black *as* jet, *as* cold *as* ice, *as* wise *as* Solomon, etc.; the verb in the relative clause, when the same as in the principal clause, being usually omitted: as, it is *as* cold *as* ice (sc. is); come *as* soon *as* you can (sc. come).

He was *al so* [var. *also*, *als*, *as*] fresche *as* is the moneth of Mai. *Chaucer*, Gen. Prol. to C. T., l. 92.

Lo! whiche sleightes and subtiltees
In wommen ben! for ay *as* bisy *as* bees
Ben they, vs sely men for to deceyve.
Chaucer, Squire's Tale, Prol., l. 4.

We [Americans] use these words [faith and hope] as if they were *as* obsolete *as* Selah and Amen.
Emerson, Man the Reformer.

The relative clause is often omitted, especially in colloquial speech, being inferred from the antecedent: as, this will do *as* well (sc. *as* that); I would *as* lief walk (sc. *as* ride).

The bad man shall attend *as* bad a master.
Fletcher, Wife for a Month, v. 3.

I will be temperate
In speaking, and *as* just in hearing.
Beau. and Fl., Philaster, iv. 3.

Milton, Eikonoklastes, xi.

The appointment of a regular wit has long ceased to be a part of the economy of a morning paper. Editors find their own jokes, or do *as* well without them.
Lamb, Newspapers 35 Years Ago.

II. *conj.* (*conjunctive* or *relative adv.*). **1.** The consequent in the correlations *as* . . . *as*, *so* . . . *as*, *such* . . . *as*, *same* . . . *as*, etc., expressing quantity, degree, proportion, manner, etc. The relative uses are as exhibited in I. (where see examples). Through ellipsis of the antecedent, it enters into many peculiar idiomatic phrases.

No, 'tis not *so* deep *as* a well, nor *so* wide *as* a church-door; but 'tis enough, 'twill serve.
Shak., R. and J., iii. 1.

His resolutions were *as* fained *as* his vows were frustrate. *Milton*, Eikonoklastes, xxv.

The clauses may be transposed for emphasis.

I live *as* I did, I think *as* I did, I love you *as* I did.
Swift.

It is in criticism, *as* in all other Sciences and Speculations. *Addison*, Spectator, No. 291.

In parenthetical clauses involving a concession, the relative *as* (the antecedent being omitted) may be equivalent to *though*: as, late *as* it was, we set forth on our journey.

Trite *as* the counsel was, . . . in this emergency it was to me as if an angel had spoken.
Lamb, Amicus Redivivus.

Neither the arguments nor entreaties of his friends, backed *as* they were by the avowed wishes of his sovereign, could overcome his scruples.
Prescott, Ferd. and Isa., ii. 5.

In parenthetical clauses involving a contrast or negation as to fact with the principal clause, *as* approaches an adversative sense, being nearly equivalent to *but*.

Had I but time, (*as* this fell sergeant, Death,
Is strict in his arrest,) O, I could tell you,—
But let it be. *Shak.*, Hamlet, v. 2.

I must confess I lov'd her; *as* who would not?
Fletcher, Loyal Subject, v. 7.

In subordinate clauses involving a supposition, *as* is conditional, being equivalent to *as if*, *as though*, which are the ordinary forms. This use is now rare or only poetical except in the independent phrase *as it were*. (See phrases below.)

It lifted up its head, and did address
Itself to motion, like *as* it would speak.
Shak., Hamlet, i. 2.

And all at once their breath drew in,
As they were drinking all.
Coleridge, Ancient Mariner, l. 165.

The young lambs bound
As to the tabor's sound.
Wordsworth, Intimations of Immortality.

The clause introduced by *as* may be reduced by ellipsis of its verb and other elements to one or two important words, leaving *as* as a quasi-connective: (*a*) Between an adverb or adverbial phrase in the principal clause and an adverb or adverbial phrase constituting the subordinate clause.

It suffices me to say . . . that men here, *as* elsewhere, are indisposed to innovation. *Emerson*, Lit. Ethics.

(*b*) Between the principal verb or its subject and the subordinate subject or object, which becomes equivalent to a predicate appositive or factitive object after the principal

verb, *as* meaning 'after the manner of,' 'the same as,' 'like, 'in the character or capacity of,' etc.: as, the audience rose *as* one man; all these things were *as* nothing to him; he has been nominated *as* a candidate. Hence in constructions where the appositive clause depends directly upon the noun: as, his career *as* a soldier was brilliant; his reputation *as* a scholar stands high: and so in naming phases of a general subject: as, Washington *as* a general; man *as* a thinker. The construction as a quasi-predicate appositive or factitive object after a principal verb is usual after verbs of seeming or regarding.

Evil was embrac'd for good, wickedness honour'd and esteem'd *as* virtue. *Milton*, Hist. Eng., iii.

That law which concerneth men *as* men.
Hooker, Eccles. Pol.

This gentleman was known to his contemporaries *as* a man of fortune, and *as* the author of two successful plays.
Macaulay.

Our age is bewailed *as* the age of Introversion.
Emerson, Amer. Scholar.

The subordinate clause introduced by *as* is often not dependent grammatically upon the principal verb, but serves to restrict or determine the scope of the statement as a whole. Such clauses are parenthetical, and usually elliptical, some of them, as *as usual* and *as a rule*, having almost the idiomatical unity of an adverbial phrase.

The streets were narrow, *as* is usual in Moorish and Arab cities. *Irving*, Granada, p. 2.

In certain emphatic formulas, *as* ('even as') introduces a solemn attestation ('as truly or surely as') or adjuration ('in a manner befitting the fact that'), approaching a causal sense, 'since, because.' (See 2, below.)

To punish baseness, shew it!

4. Of purpose or result: The consequent in the correlations *so . . . as, such . . . as:* To such a degree that; in such a manner that: followed by an infinitive or, formerly, by a finite verb (but in the latter construction *that* has taken the place of *as*).

5. Of mere continuation, introducing a clause in explanation or amplification of a word or statement in the principal clause, especially in giving examples: For example; for instance; to wit; thus.

Winter birds, *as* woodcocks and fieldfares. *Bacon.*

A simple idea is one idea; *as* sweet, bitter. *Locke.*

6. In dependent clauses: That. Formerly *as* was often attached, like *that*, to the adverbs *there, then, where, when*, etc., to make them distinctly relative. These forms are now obsolete, except *whereas*, which remains in a deflected sense. See *whereas*. From this interchange with *that* followed the use of *as* for *that*, in introducing an object clause after *say, know, think*, etc., varying with *as that* and *as how*: only in dialectal use: as, I don't know *as* I do', and I don't know *as'* I do, the sense varying with the accent. We can proceed in the *ascertainment* of internal truths as we proceed in the *ascertainment* of external ones. *H. Spencer.*

A dominant religion is never *ascetic.* *Macaulay,* Dryden.

3. Pertaining to or resembling the ascetics.

II. *n.* 1. In the early Christian church, one who practised unusual self-denial and devotion; in modern usage, also one who retires from the customary business of life and engages in pious exercises; a hermit; a recluse.

2. *pl.* [*cap.*] The title of certain books on devout exercises: as, the *Ascetics* of St. Basil.

ascetical (a-set'i-kal), *a.* [< *ascetic* + *-al.*] Pertaining to the practice of rigid self-denial and the mortification of the body as a means of attaining virtue and holiness; ascetic.—**Ascetical theology,** a name given to the science which treats of virtue and perfection and the means by which they are to be attained. *Cath. Dict.*

ascetically (a-set'i-kal-i), *adv.* In an ascetical manner; by the practice of asceticism; as an ascetic; to or toward asceticism: as, persons *ascetically* inclined.

asceticism (a-set'i-sizm), *n.* [< *ascetic* + *-ism.*] 1. The life or practice of an ascetic; the principles and historic course of the ascetics. In ancient Greece *asceticism* (*ἄσκησις*) meant the discipline undergone by athletes while training. In the schools of the Stoics the same word was applied to the controlling of the appetites and passions and the practice of virtue. Among Christians, through contact with the Alexandrian school of philosophy, the word early came into use with a similar meaning, namely, the habitual use of self-discipline, such as had been practised by individuals and even by communities among the Jews. The object of this discipline was to control and subdue the bodily nature with its passions and desires as the stronghold of evil inherent in man since the fall of Adam, the means used being fasting, celibacy, poverty, penance, and solitude, a mode of life which developed in the course of a few centuries into monasticism. Similar and even greater austerities have been practised from very early times by many among various pagan nations and in connection with various religious systems, such as Hinduism, Buddhism, etc., under the influence of the idea that matter is essentially evil, and that an approach to ideal good or an escape from the evils of existence can be effected only by subduing or torturing the body.

Asceticism again—including under this term . . . all efforts to withdraw from the world in order to cultivate a higher degree of sanctity—belongs naturally to a society which is somewhat rude, and in which isolation is frequent and easy. *Lecky,* Europ. Morals, i. 136.

2. In *theol.*, the theory or systematic exposition of the means, whether negative, as self-denial and abstinence, or positive, as the exercise of natural and Christian virtues, by which a complete conformity with the divine will may be attained. See *ascetical theology,* under *ascetical.*

★= Syn. *Self-sacrifice, Austerity,* etc. See *self-denial.*

Ascidia (a-sid'i-ä), *n. pl.* [NL., pl. of *Ascidium,* q. v.] 1. A class of animals connecting the molluscoid invertebrates with the *Vertebrata;* the tunicates, tunicaries, or sea-squirts, otherwise called *Tunicata, Ascozoa, Urochorda,* or *Protovertebrata* (in part); the ascidians. They are asymmetrical marine animals, simple or compound, fixed or free, with a monoganglionic nervous system, tubular heart, and no foot. The integument is a leathery sac, with two orifices, oral and anal. The young are free-swimming and tadpole-like, and in this larval condition show traces of vertebrate affinities in the possession of a urochord, or notochord of the tail, a condition retained permanently in one family, the *Appendiculariidæ.* They are found at low-water mark on the sea-beach, and, attached to stones, shells, and fixed objects, are dredged from deep water. An ascidian presents externally the appearance of a wine-jar or double-necked bottle, the one aperture of the bottle corresponding to the mouth and the other to the vent or excretory aperture. A feature in the organization of these animals is that a large proportion of the tough outer case or test is composed of cellulose, a starchy substance highly characteristic of plants. The mouth-opening leads into a large branchial sac or breathing-sac; and from the bottom of this sac the digestive system, consisting of stomach and intestine, is continued, the intestine opening into a second sac, the atrial chamber. This latter cavity opens externally by the second aperture of the body, and also emits the effete water which

has been used in breathing. A single nervous mass or ganglion represents the nervous system, this mass being placed between the two apertures of the body. Male and female reproductive organs exist in each ascidian. These animals may be *single* or *simple*, *social*, or *compound*. In social ascidians the peduncles of a number of individuals are united into a common tubular stem, with a partial common circulation of blood. The species are more or less gelatinous, and some are used as food in China and on the shores of the Mediterranean. The *Ascidia* are divisible into two orders not well defined, called *Biphora* and *Ascidioida*, and by other names, one containing the *Salpidæ* and *Doliolidæ*, the other the rest of the class. Also written *Ascidiæ*. See cuts under *Appendicularia*, *Doliolidæ*, *Salpa*, and *Tunicata*.

7. To invite: as, to *ask* guests to a wedding or entertainment.—**To ask in church**, to publish banns of marriage. [The verb *ask* is used in this phrase because the publication is really an inquiry whether any one can state any valid objection to the marriage.]—**Syn. 1 to 4.** *Ask, Request, Beg, Demand, Claim, Require, Solicit, Beseech, Entreat, Crave, Supplicate, Implore, Importune.* *Ask* is the generic word in this list; it implies neither that what is asked must be rendered, nor, on the other hand, that it would be a favor. *Demand, claim*, and *require* ask imperatively or authoritatively; the others call for a favor with different degrees of urgency or humility. *Beseech, solicit, entreat, importune*, and sometimes *beg*, imply great urgency; *crave, supplicate*, and *implore* imply great urgency and great dependence or humility. *Request* is a little more formal or carefully civil than *ask*: as, your attendance is *requested*. *Beg* is primarily to ask as a beggar; sometimes, by the hyperbole of social usage, to ask as a favor, real or professed: as, I *beg* your pardon. *Demand* and *claim* more often refer to things; *require* applies more often to action: as, he *demanded* his share; he *claimed* the whole; he *required* me to come; he *required* some proof to back my demand and substantiate my claim. *Solicit* is urgent, but less so than the words that follow it: as, he *solicited* my vote. *Beseech* is most applicable to the act of asking on the ground of pure favor. *Entreat* implies continued appeal or representations of a moving kind. *Crave* is almost or quite abject; like *beg*, it has been taken into polite forms of speech, and in that use robbed of most of its force. *Supplicate* and *implore* are, figuratively, modes of prayer, as to a superior being; they imply urgent or desperate appeal, perhaps in many words. To *importune* is generally to beg in a persistent, wearying way, with urgency, but perhaps without especial dependence or humility.

To *ask* and have, command and be obeyed.
Marlowe, Tamburlaine, I. iv. 3.

To-night we hold a solemn supper, sir,

With slight denial. *Shak.*, T. of A., ii. 1.

5 and **6**. *Ask, Inquire, Question, Interrogate. Ask* is here also the generic word; it is simple and informal. *Inquire* may be used in the endeavor to be civil, or it may express a more minute examination into facts: as, to *inquire* (into, as to) the causes of discontent. To *question* in this sense implies the asking of a series of questions, it being supposed that the truth is hard to get at, through ignorance, reluctance, etc., in the person questioned. *Interrogate* is essentially the same as *question*, but more formal: as, to *question* a child or servant about his conduct, to *interrogate* a witness, an applicant for office, etc. *Questioning* or *interrogation* might be resented where *asking, asking* a question, or *inquiring* would meet with a friendly response.

If we encountered a man of rare intellect, we should *ask* him what books he read.

The *maligner* is most mischievous, malicious, or *malign* in his motives. To *traduce* is to misrepresent, to show in an odious light. *Libel* and *slander* are the words most used in speaking of injury to reputation in its relation to the possible recovery of damages at law. To *libel,* therefore, often suggests the pecuniary loss by defamation; *libel* is strictly effected by publication, while *slander* is strictly by word of mouth. *Vilify* is, literally, to make one (seem) vile; it suggests a defamation of the coarser and more abusive sort. See *decry.*

I am not sure . . . whether I ought not to call you out for *aspersing* the honour of the family.
Barham, Ingoldsby Legends, I. 35.

Whenever you would ruin a person or a government, you must begin by spreading calumnies to *defame* them.
Quoted by *I. D'Israeli*, Amen. of Lit., II. 75.

One trade or art, even those that should be the most liberal, make it their business to disdain and *calumniate* another. *Bp. Sprat.*

Thou sittest and speakest against thy brother; thou *slanderest* thine own mother's son. Ps. l. 20.

You *malign* our senators, for that
They are not such as you. *Shak.*, Cor., i. 1.

If I am
Traduc'd by ignorant tongues, . . .
'Tis but the fate of place, and the rough brake
That virtue must go through.
Shak., Hen. VIII., i. 2.

His [Dr. Kendrick's] virulent attack on Johnson's Shakespeare may be preserved for its total want of literary decency. . . . He *libelled* all the genius of the age, and was proud of doing it. *I. D'Israeli*, Cal. of Auth., p. 217.

When I find the first of men, in rank and genius, hating one another, and becoming slanderers and liars in order to lower and *vilify* an opponent, . . . I look back in vain on any barbarous people for more barbarism.
Landor, Peter the Great and Alexis.

★**asphaltum** (as-fal'tum), *n.* [NL.: see *asphalt.*] One of the so-called bituminous substances which are widely diffused over the earth, and are of great practical importance. See *bitumen* and *bituminous.* The asphaltums of various localities differ from each other considerably in chemical composition, as is proved by their different chemical reactions. They all agree, however, in being amorphous, in having the luster and general appearance of pitch (whence the name of *mineral pitch*, often applied to them), in melting at about the temperature of boiling water, and in taking fire when heated and burning with a bright but smoky flame. They differ essentially from coal in being more or less soluble in various reagents, such as oil of turpentine, ether, and alcohol. Asphaltum seems, in most cases at least, to have resulted from the hardening of the more liquid forms of bituminous substances, namely, maltha and petroleum, which have oozed out upon the surface and become inspissated by oxygenation or evaporation of their more volatile portions, or by both causes combined. The most interesting locality of asphaltum is the so-called "pitch-lake" in the island of Trinidad, about a mile and a half in circumference, and filled with asphaltum, which near the shore is quite solid, but nearer the center, in places, is soft and bubbling. Most of what is called asphaltum consists of this material more or less mixed with sand or other mineral substances. Asphaltum is extensively used in a variety of ways, and especially for pavements, footwalks, and roofing. For this purpose the material is prepared by mixing it while hot with sand or fine gravel, or by causing it to be absorbed by paper. Certain kinds of asphaltic rock, or asphalts (F. *asphalte*), as they are frequently called, are peculiarly adapted for pavements or other special purposes. The localities of Seyssel in France and Val de Travers in Switzerland are the most important of this kind. At each of these the *asphalte* consists of limestone impregnated with bituminous material to the amount of from 4 to 16 per cent. This rock, especially that from Val de Travers, has the remarkable property of forming, without any admixture, an extraordinarily durable and elastic roadway, and is, although expensive, extensively used for that purpose in Paris and other large cities of Europe. The rock has only to be heated, when it crumbles to powder, in which condition it is compressed in molds into blocks, or simply spread over the surface required to be covered, and packed or pressed by pestle or roller, when, after cooling, it assumes a condition closely resembling that of the original rock. See *maltha*, *naphtha*, and *petroleum.* Also *asphalt.*

A colony migrated from Persia to Syria, settled in various places, with their chief seat on the mountains of Lebanon, and became remarkable for their secret murders in blind obedience to the will of their chief. Their religion was a compound of Magianism, Judaism, Christianity, and Mohammedanism. One article of their creed was that the Holy Spirit resided in their chief and that his orders proceeded from God himself. The chief of the sect is best known by the denomination *old man of the mountain* (Arabic *sheikh al-jebal*, chief of the mountains). These barbarous chieftains and their followers spread terror among nations far and near for almost two centuries. In the time of the crusades they mustered to the number of 50,000, and presented a formidable obstacle to the arms of the Christians. They were eventually subdued by the sultan Bibars about 1272.

The law was first made against those employing infidels to murder Christians, but almost immediately and a fortiori extended to Christians as against any person, whether Christian or not, who was allowed to live in the state. Royal assent, in England, the approbation given by the sovereign in Parliament to a bill which has passed both houses, after which it becomes law. This assent may be given in two ways: (*a*) In person, when the sovereign comes to the House of Peers, the Commons are sent for, and the titles of all the bills which have passed are read. The royal assent is declared in Norman-French by the clerk of the Parliament. (*b*) By letters patent under the great seal, signed by the sovereign, and notified in his or her absence. A money-bill, or bill of supply, passed by the House of Commons, is presented by the Speaker for the royal assent.—**Syn.** *Assent, Consent, Concurrence, Acquiescence,* acceptance, adherence. *Assent* is primarily an act of the understanding; *consent* is distinctly the act of the will: as, I *assent* to that proposition; I *consent* to his going. Baxter speaks of justifying faith as the *assenting* trust of the understanding and the *consenting* trust of the will. *Assent* is not yet altogether excluded from the field of the will, but tends to express a feebler action of the will than it formerly did, or than *consent* does. Compare Luke xxiii. 24 (margin), "Pilate *assented* that it should be as they required," with the formal *consent* in the royal *assent* to a bill. *Concurrence* is a running of minds in the same channel, an agreement in opinion or decision. *Acquiescence* is a state or act of quiet submission to a decision, an act, or the prevalence of an opinion, because it is near enough to one's wishes, or not worth resisting, or impossible to resist, but not because it is entirely acceptable.

Assent I have described to be a mental assertion; in its very nature then it is of the mind, and not of the lips.
J. H. Newman, Gram. of Assent, p. 11.

If any faction of men will require the *assent* and *consent* of other men to a vast number of disputable and uninstituted things, and, it may be, a mathematical falsehood among the first of them, and utterly renounce all Christian communion with all that shall not give that *assent* and *consent*, we look upon those to be separatists; we dare not to be so narrow-spirited.
C. Mather, Mag. Chris., Int. to iii.

The necessity, under which the jury is placed, to agree unanimously, in order to find a verdict, acts as the predisposing cause of *concurrence* in some common opinion.
Calhoun, Works, I. 66.

The E. sense of *assibilate* depends on that of *sibilant*.] To render sibilant, as a sound; change into a sibilant or hissing sound; alter, as a sound, by the phonetic process called assibilation. The term may be applied to the whole word so affected: as, *church* is an *assibilated* form of *kirk*.

assibilation (a-sib-i-lā'shọn), *n.* [< *assibilate.*] The act of making sibilant; specifically, in *philol.*, the change of a dental or guttural (or a labial) mute into a sibilant (*s*, *z*, *sh*, *zh*, *ch* = *tsh*, *j* = *dzh*), or into a sound approaching that of a sibilant, as for instance a palatal. This change usually results from a tendency to accommodate the mute to an immediately succeeding *e*, *i*, or *y* sound. Thus, *t* in the Latin *natio* becomes *z* (= *ts*) in the Italian *nazione*, and is pronounced *s* in the French *nation* and *sh* in the English *nation*. We speak of plodding *industry*, patient *assiduity*, steady *application*, great *diligence*, unshaken *constancy*, undaunted *perseverance*, *persistence* that will not take No for an answer.

Sat by the walls, and no one open'd to him.
And this *persistence* turn'd her scorn to wrath.

Just as the older female deities were *associated* in their worship *with* heaven and the heavenly bodies, *with* seasons of the year and *with* sacred places, so is the more modern goddess [the Virgin Mary]. *Dawson*, Nature and the Bible, p. 215.

2†. To keep company with; attend.

Friends should *associate* friends in grief and woe. *Shak.*, Tit. And., v. 3.

To-morrow I will *associate* you to court myself. *B. Jonson*, Every Man out of his Humour, ii. 1.

3. To make an associate of; admit to association or membership: with *to*: as, "he was *associated to* the Royal Academy," *Southey*. [Rare.]—**Associated functions.** See *function*.

II. *intrans.* **1.** To have intercourse; be an associate or associates: implying intimacy: as, congenial minds are disposed to *associate*.

It was once degradation intensified for a Norman to *associate* with a Saxon. *N. A. Rev.*, CXXXIX. 85.

2. To join in or form a confederacy or association.

The clergy of a district in the diocese of Lincoln *associated* lately for the purpose of forming an estimate of the state of religion within their own limits. *Sydney Smith*, in Lady Holland, iii.

3. In general, to unite, as in action, with a person or thing, or to coexist in organic dependence, as the parts of the body.

associate (ə-sō'shi-āt), *a.* and *n.* [< L. *associatus*, pp.: see the verb.] **I.** *a.* **1.** Joined in interest, object or purpose, office or employment; combined together; joined with another or others: as, an *associate* judge or professor; "my *associate* powers," *Milton*, P. L., x. 395.—**2.** In *pathol.*, connected by habit or sympathy: as, *associate* movements, that is, movements which occur sympathetically, in consequence of preceding motions: thus, convergence of the eyes is associated with contraction of the pupils.

II. *n.* **1.** A companion; one who is on terms of intimacy with another; a mate; a fellow.

Compare above all living creatures dear!

The one [idea] no sooner . . . comes into the understanding than its *associate* appears with it. *Locke*, Human Understanding, ii. 33.

=Syn. 1 and **2.** *Associate, Friend, Companion, Comrade, Fellow, Partner, Ally, Colleague, Coadjutor, Confederate.* *Associate* is the most general word for persons who are connected in life, work, etc.; it is special only in suggesting an alliance of some permanence. *Friend* is the most general word for persons who, through community of life or otherwise, have kindly feelings toward each other. *Companion*, literally a messmate, applies where the persons are much thrown together, but are not united by any strong tie; hence it is not a good synonym for *husband* or *wife*. "Many men may be admitted as *companions* who would not be altogether fit as *associates*," *Crabb*, Eng. Synonymes,

p. 197. *Comrade* denotes a close companion; it implies freedom of intercourse and a good degree of friendship: as, *comrades* in arms. *Fellow* has nearly lost its early signification of agreeable companionship, the later meanings having overshadowed it: as, "a bettre *felawe* schulde men noght fynde," *Chaucer*. Compare *fellow-feeling, fellow-helper, fellowship*. *Fellow* in this connection may mean one who naturally would be or is a companion: as, why do you not go with your *fellows?* A *partner* is one who takes part with others, especially in business or in any kind of joint ownership. Formerly *ally* was nearly equivalent in meaning to *associate*, but it is now applied chiefly to states or rulers in their public capacity: as, the *allies* in the Crimean war. A *colleague* is an associate for some specific purpose or in some office; it is, like *coadjutor*, properly applicable only to one engaged in labor or business regarded as especially dignified: as, Senators A and B were *colleagues;* Luther and his *coadjutors*. A *confederate* is one somewhat formally associated with others, now usually, when applied to private relations, for a bad object. See *accomplice*.

A nice and subtle happiness, I see,
Thou to thyself proposest, in the choice
Of thy *associates*, Adam! *Milton*, P. L., viii. 401.

Thou shalt never find a *friend* in thy young years whose conditions and qualities will please thee after thou comest to more discretion and judgment. *Raleigh*, To his Son.

One that has well digested his knowledge, both of books and men, has little enjoyment but in the company of a few select *companions*. *Hume*, Essays.

Thus he moved the Prince
To laughter and his *comrades* to applause.
Tennyson, Geraint.

I and my *fellows*
Are ministers of fate. *Shak.*, Tempest, iii. 3.

Myself and other noble *friends*
Are *partners* in the business. *Shak.*, Cymb., i. 7.

The old company . . . was able, with the help of its Tory friends, to prevent the rival *association* from obtaining similar privileges. *Macaulay*, Hist. Eng., xx.

Articles of association or **incorporation.** See *article*. —**Association of ideas** (an expression introduced by Locke), or **mental association,** in *psychol.*, the tendency of a perception, idea, or thought to recall to consciousness others which have previously coexisted in consciousness with it or with processes similar to it; or the conscious resultant of this tendency. Thus, the name of a friend is associated with his personal appearance, age, place of residence, and so on; and the sound of the name may bring to consciousness one or more of these associated ideas. The various *types of association*, though differently given by psychologists, are usually reduced to those of contiguity and similarity; that is, ideas recall ideas which have occurred along with them, and also those which are similar to them. The doctrine of association has played an important part in modern English psychology and philosophy. The laws of the associative consciousness have been experimentally investigated.

The phrase, *intrinsic and extrinsic association*, might be introduced very appropriately to distinguish associations founded on intrinsic resemblances of mental states from those which merely imply the extrinsic accident of simultaneous occurrence in consciousness. *T. Clarke Murray*.

Association philosophy, the doctrine put forward by Hobbes, Hume, Hartley, James Mill, and others, that the operations of the mind are to be explained chiefly by the association of ideas.—**Evangelical Association.** See *evangelical*.—**Free Religious Association.** See *free*.—**Indissoluble** or **inseparable association,** an association of ideas so strong that we cannot think one without also thinking the other.—**Voluntary association,** in *law*, a society which is unincorporated, but is not a partnership, in that the members are not agents for one another.=**Syn. 2.** Combination, company, club, lodge, fraternity.

2. In *math.*, applied to an operation which gives the same result whether it first unites two quantities A and B, and then unites the result to a third quantity C, or whether it first unites B and C, and then unites the result to A, the order of the quantities being preserved. Thus, addition and multiplication are said to be associative, on account of the general formulas,

$$(a + b) + c = a + (b + c)$$
$$(a \times b) \times c = a \times (b \times c).$$

In the same sense, mathematicians often use the expressions *associative formula, associative principle*.—**Associative algebra,** a system of algebra in which multiplication is associative.

Ἀσσύριος, pertaining to Ἀσσυρία, Assyria.] **I.** *a.* Pertaining or relating to Assyria or to its inhabitants.—**Assyrian architecture**, the most important branch of the architecture of Mesopotamia, developed in Assyria during the period of its supremacy. Its chief monuments were the royal palaces, which were of enormous extent, and constructed of massive walls of sundried brick on great mounds of clay, of which they have now virtually become a part, owing to the disintegrating influence of time and the elements upon their friable materials. They were never more than one or two stories high, owing to the limited endurance of the unbaked bricks, and consisted chiefly of corridors and long, narrow halls, either arched over with brick or closed in with ceilings of wood, and surrounding open courts. The entrances were of imposing height and width, ornamented with colossal stone figures of winged human-headed bulls or lions, or other mythological conceptions. The interior walls were commonly lined with a revetment of soft alabaster slabs, on which were carved in low relief the remarkable series of sculptures which have preserved the record of Assyrian triumphs, character, and customs. Color in somewhat subdued tints was generally employed upon the sculptures and the wall-spaces. The temple, in Assyria, was subordinate to the palace, the opposite being the case in Babylonia.—**Assyrian art**, one of the later branches of Mesopotamian art, parallel to the later Babylonian. Its most characteristic manifestation is presented in its lavish sculptured architectural decoration in low relief. In its first period, culminating in the ninth century B. C., it displayed great vigor and truth in its interpretation of nature, particularly in its portrayal of animal forms. Later it suffered a decline until the close of Assyrian supremacy, toward the end of the seventh century B. C. Its human figures never have the life and force of its animals, but are

They have a more or less lobed or pentagonal disk; lobes continuous with the disk, receiving prolongations of the viscera, and bearing tube-feet with suckers, as locomotory organs; and an aboral madreporic body. The group includes several families, as *Brisingidæ*, *Pterasteridæ*, *Astropectinidæ*, *Asterinidæ*, *Goniasteridæ*, *Linckiidæ*, and *Asteriidæ*, or the starfishes proper as distinguished from the sand-stars and other echinoderms of the class *Stellerida* (which see). They have a coriaceous skin, in which are implanted spines or tubercles. The body is expanded into arms, the under surface of which is marked with grooves, radiating from the center, and pierced with rows of holes, whence issue tentacular feet, by means of which the animals move. Most have 5 arms or rays, but some have more, varying from 8 to 30. They have the power of reproducing these arms if they are broken off; and if an entire arm, with a small portion of the body attached to it, is torn off, it forms a new and perfect animal. The mouth is in the inferior center of the rays, is not provided with teeth, and leads by a short gullet into a large stomach, from which a pair of lateral tubes are prolonged into each ray. A distinct intestine and anus may or may not be present. The animals feed chiefly on mollusks.

The "*Asterolepis* of Stromness" has been given wide publicity by the writings of Hugh Miller, but the fish described by him under this name in the "Footprints of the Creator" has proved to belong to the genus *Homosteus*, one of the *Arthrodira* (a subclass of Paleozoic fishes, which see in the supplement), of which *Coccosteus* and *Dinichthys* are the best-known examples. The forms *aston, astone, astun, astony, astonish*, and *astound* are thus variations of the same word. The science or doctrine of the stars; practical astronomy; astronomy in its earliest form. The term is now restricted in meaning to the pseudo-science or art which assumes that the heavenly bodies exert, according to their relative positions at certain times, a direct influence upon human life and destiny, and which proposes to determine in any given case what this influence is, and thus to foretell the future. Thus, one's temperament was ascribed to the planet under which he was born, as *saturnine* from *Saturn*, *jovial* from *Jupiter*, *mecurial* from *Mercury*, etc.; and the virtues of herbs, gems, and medicines were supposed to be due to their ruling planets. There are four branches of astrology: *horary astrology*, that branch of the art which shows how to answer questions by the figure of the heavens at the moment when the question arises; *mundane astrology*, that branch of astrology which professes to foretell human affairs; *genethliac astrology*, astrology applied to determining the destiny of a person from the configuration of the planets at his birth; and *astrometeorology*, which professes to predict natural effects, as changes of the weather, winds, storms, etc.

For its bad sense, see *cunning.*

Hence—**2.** Inviolable shelter; protection from pursuit or arrest; security of the person: as, the right of *asylum,* that is, of furnishing such protection. Most Grecian temples had anciently this right, and the custom, following Jewish analogies, passed into the Christian church. From the fourth century the churches had widely extended rights of asylum, but modern legislation has nearly everywhere ended the custom. (See *sanctuary.*) In *international law,* the right of asylum was formerly claimed for the houses of ambassadors. The term now specifically signifies the right of one state to receive and shelter persons accused of crimes, or especially of political offenses, committed in another. See *extradition.*

II. *n.* A straight line whose distance from a curve is less than any assignable quantity, but which does not meet the curve at any finite distance from the origin. The asymptote is often defined as the tangent to the curve at an infinite distance, and this definition answers for Euclidean space; but, in view of non-Euclidean hypotheses, it is preferable to define it as a common chord of the curve and the absolute (which see), and thus as not necessarily a tangent.

asymptotic (as-im-tot'ik), *a.* Same as *asymptotical.*

asymptotical (as-im-tot'i-kal), *a.* [< *asymptotic* + *-al.*] Belonging to or having the character of an asymptote; approaching indefinitely near, but never meeting.

at (at), *prep.* [< ME. *at*, sometimes *att*, *atte*, *et*, < AS. *æt* = OS. *at* = OFries. *et* (in combination also *at*, *it*) = OHG. *az* = Icel. *at*, mod. *ath* = Sw. *åt* = Dan. *ad* = Goth. *at* = L. *ad* (> It. *a* = Sp. *á* = Pg. *a* = F. *à*), to, at, = Skt. *ādhi*, unto, on. This prep. is most nearly equiv. to *to*, without the orig. implication of motion. In many constructions the two prepositions interchange. In many E. dialects *at* has partly, and in Scand. has wholly, displaced *to*, while on the other hand in G. *to* (*zu*) has wholly displaced *at*. In L. and Rom. the form cognate with *at* covers all the uses of *to* as well as of *at*, and extends partly over the field of *with*.] A preposition of extremely various use, primarily meaning to, without implication, in itself, of motion. It expresses position attained by motion to, and hence contact, contiguity, or coincidence, actual or approximate, in space or time. Being less restricted as to relative position than other prepositions, it may in different constructions assume their office, and so become equivalent, according to the context, to *in*, *on*, *near*, *by*, *about*, *under*, *over*, *through*, *from*, *to*, *toward*, etc.

1. Of simple local position: (*a*) With verbs of rest (*be*, *live*, etc.): In, on, near, by, etc., according to the context: denoting usually a place conceived of as a mere point: as, *at* the center, *at* the top, *at* the corner, *at* the end, *at* the next station, *at* the bend of the river, *at* the north pole, *at* No. 48 Main street, etc. So with names of towns, etc.: as, *at* Stratford, *at* Lexington, etc.; but if the city is of great size *in* is commonly used: as, *in* London, *in* Paris, *in* New York; unless, again, the city is conceived of as a mere geographical point: as, our financial interests center *at* New York. The place implied by *at* may be left indeterminate, with a reference rather to condition than to mere location: as, *at* school, *at* college, *at* court, *at* sea, etc. *At* may also express personal proximity: as, *at* one's side, *at* one's heels, *at* one's elbow, etc. *At hand*, near by, has lost its personal reference.

(2) From (implying a source from which a thing comes or where it is sought): as, to receive ill treatment *at* their hands. (3) To, toward (implying a stopping-point, a position attained or aimed at): as, to come *at*, to get *at*, to aim *at*, fire *at*, shoot *at*, drive *at*, point *at*, look *at*, shout *at*, reach *at*, snatch *at*, clutch *at*, etc.; also be *at* when it implies effort directed toward a thing.

ate[1] (āt). Preterit of *eat.*

Ate[2] (ā'tē), *n.* [< Gr. Ἄτη, a personification of *ἄρη*, infatuation, reckless impulse, sin, ruin, dial. *αὐάτα*, orig. **ἀϝάρη*, < *ἀάειν*, orig. **ἀϝάεινω*, hurt, damage.] In *Gr. myth.*, an ever-present evil genius leading men on to crime; the goddess of blundering mischief; a personification of the reckless blindness and moral distortion inflicted by the gods in retribution for presumption and wickedness, typifying the self-perpetuating nature of evil.

-ate[1]. [ME. reg. *-at*, < OF. *-at*, a later "learned" form of vernacular *-e* (*-é*), fem. *-ee* (*-ée*), = Sp. Pg. *-ado*, fem. *-ada*, = It. *-ato*, fem. *-ata*, < L. *-ātus*, fem. *-āta*, neut. *-ātum* (stem *-āto-*), pp. and adj. suffix, being *-tu-s* (= Gr. *-το-ς* = E. *-d*[2], *-ed*[2]), added to stem of verbs in *-ā-re* (It. *-are*, Sp. Pg. *-ar*, F. *-er*). This suffix also appears as *-ade*[1], *-ado, -ato, -ee, -y*, etc. Latin adjectives and participles in *-ātus* were usable as nouns, in masc. of persons, as *legātus*, one deputed, a legate, ML. *prælātus*, one preferred, a prelate, etc., in neut. of things, as *mandātum*, a thing commanded, a mandate, etc. See *-ate*[2] and *-ate*[3].] A suffix of Latin origin: (*a*) In adjectives, where *-ate* is equivalent to and cognate with English *-ed*[2], *-d*[2], *-t*[2], in perfect participles and participial adjectives, the native English suffix being often added to *-ate* when a verb in *-ate*[2] exists, as in *desolate* or *desolat-ed, accumulate* or *accumulat-ed, situate* or *situat-ed*, etc. In many instances the adjective is not accompanied by a verb in *-ate*, as *innate, ornate, temperate*, etc.; this is especially true of botanical descriptives, as *acuminate, crenate, cuspidate, hastate, lanceolate, serrate*, etc. (*b*) In nouns, of persons, as *legate, delegate, reprobate*, etc., or of things, as *mandate, precipitate*, etc.; especially, in *chem.*, in nouns denoting a salt formed by the action of an acid on a base, as in *acetate, nitrate, sulphate*, etc., the suffix being added to the stem (often shortened) of the name of the acid. [The corresponding New Latin forms are *acetatum, nitratum, sulphatum*, etc., but often erroneously *acetas, nitras, sulphas*, genitive *acetatis*, etc., by confusion with *-ate*[4].]

-ate[2]. [L. *-ātus, -āta, -ātum*, pp. suffix of verbs in *-ā-re* (see *-ate*[1]), with supine in *-ātum* (stem *-ātu-*), to which, instead of the pp. stem, such verbs are often referred. In this dictionary E. verbs in *-ate* (and so verbs in *-ete, -ite*) are reg. referred to the L. pp. *-ātus* (*-etus, -itus*), intimating that such verbs are taken from or formed according to the L. pp. stem, though with the force of the inf. From L. participles in *-tus* (*-ā-tus*, of the 1st conjugation, *-ē-tus*, *-i-tus*, of the 2d, *-tus, -sus*, of the 3d, *-ī-tus*, of the 4th), and from thence-formed frequentatives, which became very numerous in LL. and ML., arose many verbs in OF. and ME., based, or appar. based, on L. participles, coinciding thus with adjectives and nouns from such participles. These, with verbs of other origin agreeing in form with adjectives, have made it a rule in E. that any adj. may be made a verb; hence adjectives in *-ate*[1] are usually accompanied by a verb in *-ate*[2], and new verbs from L. verbs of the 1st conjugation are reg. formed in *-ate*, whether a corresponding adj. exists or not; and *-ate*[2], as a recognized verb-formative, may be suffixed to other stems of any origin, as in *felicitate, capacitate, substantiate, assassinate, camphorate*, etc., based on *felicity, capacity, substance*, etc., of Latin origin, *assassin, camphor*, etc., of other origin. Owing to the preponderance of verbs in *-ate* over adjectives in *-ate*, such verbs are in this dictionary placed before the adjectives, even when the adjectives are of earlier date.] A suffix of Latin origin, a common formative in verbs taken from the Latin, as in *accumulate, imitate, militate*, etc., or formed in English, either on Latin stems, as in *felicitate, capacitate*, etc., or on stems of other origin. See etymology.

-ate[3]. [< ME. *-at*, < OF. *-at*, a later "learned" form of vernacular *-e* (*-é*) (as in *duché*, E. *duch-y*, q. v.), = Sp. Pg. *-ado* = It. *-ato*, < L. *-ātus* (stem *-ātu-*), forming nouns of the 4th declension from nouns, but formed as if from verbs in *-ā-re*, with suffix *-tu-*, parallel with *-to-*, suffix of pp. (hence the similarity to pp. *-ātus*, E. *-ate*[1], q. v.), as in *consulātus, magistrātus, pontificātus, senātus*, LL. *episcopatus*, etc., with senses as in corresponding E. words.] A suffix of Latin origin, denoting office, an office, a body of officers, as in *consulate, pontificate, decemvirate, senate* (Latin *senātus*, from *senex*, an old man), *episcopate*, etc., and sometimes a single officer, as *magistrate* (Latin *magistrātus*, properly magistracy, also a magistrate), the suffix in the last use being equivalent to *-ate*[1] in *legate*, etc., and to *-ate*[4] in *primate*, etc.

-ate[4]. [< L. *-as* (*-at-*), as in *magnas* (gen. *magnātis*) (parallel to *magnatus*), *primas* (prop. adj.), etc.] A suffix of Latin origin, practically equivalent to *-ate*[1] in nouns, and *-ate*[3] (in *magistrate*), as in *magnate, primate*, and (in Latin plural) *penates, optimates.*

-ate[5]. [< L. *-āta*, < Gr. *-ατης*, a noun suffix, ult. = L. *-ātus*, which differs in the inflexive syllable.] A suffix of Greek origin, occurring unfelt in *pirate* (which see).

It consisted regularly of the tall conical white cap of upper Egypt, flanked with a pair of long ostrich-plumes, and having the solar disk and uræus in front, and was probably emblematic of the sovereignty of Egypt under the attributes of light, truth, and divinity. The conical cap is sometimes omitted in works of art. The atef is often mentioned in the "Book of the Dead," and is frequently represented in frescos, bas-reliefs, and statues.

As the water transudes through the porous substance, and is removed in the form of vapor by the air, the extent of evaporation is shown by the sinking of the water in the graduated tube.

★**atmosphere** (at′mos-fēr), *n.* [= F. *atmosphère* = Pg. *atmosphera* = Sp. *atmósfera* = It. *atmosfera* = Sw. *atmosfer* = Dan. *atmosfære* = G. *atmosphäre*, < NL. *atmosphæra*, < Gr. *ἀτμός*, vapor, + *σφαῖρα*, sphere: see *sphere*.] **1.** The aëriform fluid which surrounds the earth, and extends to an undetermined height above its surface; the air. It is a mechanical mixture of 79 parts by volume of nitrogen and 21 of oxygen, with nearly one per cent. of argon, a trace of carbon dioxid, and a variable quantity of aqueous vapor, ammonia, ozone, and organic matter. The composition of the normal atmosphere varies but slightly in different localities, although near towns it usually contains impurities, such as sulphuric acid, hydrochloric acid, etc. The movements of the atmosphere constitute the winds, and in it are formed or produced clouds, rain, and snow. Its density is greatest at the earth's surface, and decreases as the height above the earth increases. The atmosphere, like other bodies, gravitates toward the earth, and therefore has weight and exerts pressure. The average pressure exerted by the atmosphere at the level of the sea is about 15 pounds (14.7) to the square inch.

2. A conventional unit of atmospheric pressure. An atmosphere is in English use the pressure of a vertical column of 30 inches of mercury at the freezing-point at London; in French use it is the pressure of 760 millimeters of mercury at the freezing-point at Paris. For the absolute atmosphere in the C. G. S. (centimeter-gram-second) system, see *absolute*. The weight of the atmosphere to the square inch is commonly employed as a convenient unit for pressures arising from other causes, such as the weight of liquids, the force of steam, etc.: thus, a pressure in a steam-boiler of 3 atmospheres means a pressure equal to 45 pounds per square inch.

The apparatus . . . was of great simplicity, all of glass, capable of resisting the pressure of many *atmospheres*. *Science*, VIII. 56.

3. The gaseous envelop surrounding any of the heavenly bodies.

No sound, either loud or soft, could be heard by any inhabitant of the moon, because the moon practically has no *atmosphere*. *J. N. Lockyer*, Spect. Anal., p. 22.

4. Any gaseous medium.

For an *atmosphere* of any gas at uniform temperature, the height at which the density would be halved is the height of the homogeneous atmosphere for that gas, multiplied by .69315; the gas is assumed to obey Boyle's law. *J. D. Everett*, Units and Phys. Const., p. 41.

5†. An assumed outer envelop of force, effluvia, etc., surrounding a body: as, an electrical *atmosphere*.—**6.** Figuratively, intellectual or moral environment; pervading influence.

Cold in that *atmosphere* of Death.

This engine, invented by Papin in 1695, was first made a practical success by Newcomen, and was subsequently greatly improved by Watt, through the addition of a separate condenser and air-pump.—**Atmospheric governor**, an apparatus for controlling the movements of machinery by the use of air under pressure.—**Atmospheric hammer.** (*a*) A hammer driven by means of compressed air, as the steam-hammer is operated by steam. See *steam-hammer*. (*b*) A hammer in which an atmospheric spring is employed. The hammer-head is connected by a rod with a piston working in a cylinder to which air is admitted at the center of its length. A reciprocating motion is given to the cylinder, and by means of the air confined between its other end and the piston a corresponding motion is given to the piston-head connected with it.—**Atmospheric line.** (*a*) In a diagram of steam-pressure, a line drawn by the pencil when the steam is shut off from the piston of the indicator, and thus under the pressure of the atmosphere alone. The height of the steam-line above this shows the pressure of the steam, and the depth of the vacuum-line below shows the degree of condensation which is then taking place in the engine. (*b*) *pl.* Dark lines in the solar spectrum produced by the gases and vapors of the earth's atmosphere: often called *telluric lines*. See *spectrum*.

Atmospheric pressure. See *atmosphere*, 2.—**Atmospheric pump**, a pump in which the water is forced into the suction-pipe by atmospheric pressure.—**Atmospheric railway**, a railway so constructed that the motive power is derived from the pressure of the atmosphere acting on a piston working in a continuous iron tube of uniform bore laid from one place to another, the pressure being created by exhausting the air from that end of the tube toward which it is desired that the piston should advance, or by forcing in air behind it, or by both methods at once. The system has not been found suitable for the ordinary purposes of a railway, though it is successfully worked for the conveyance of letters, telegrams, and light packages. See *pneumatic despatch*, under *pneumatic*.—**Atmospheric spring**, a spring formed by the elasticity of a confined body of air.—**Atmospheric stamp**, a stamp operated in the same manner as an atmospheric hammer (which see, above).—**Atmospheric tides**, diurnal oscillations of the atmosphere, produced by the attractions of the sun and moon, like the tides of the ocean, and indicated by minute variations of pressure on the barometer.

Such islands are very common in the Pacific ocean. They often present an exceedingly picturesque appearance, a comparatively narrow strip of coral rock thinly coated with soil, and covered with a vigorous growth of cocoa-nut-, pandanus-, and breadfruit-trees, inclosing a large still sheet of water, usually of considerable depth, and often well supplied with fish. The circle of coral is sometimes complete, showing no apparent communication between the inclosed lagoon and the surrounding sea; but generally it is interrupted, and presents one or more openings suitable for the passage of boats.

atom (at′om), *n.* [Early mod. E. also *atome*, ★*attom* (and as L. *atomus, atomos*, with pl. *atomi*, sometimes *atomie*, > E. sing. *atomie, atomy*[1], q. v.), < ME. *attome, atome*, < F. *atome* = Sp. *átomo* = Pg. (*b*) A particle of matter assumed not to be divided under the circumstances considered; a molecule (physical atom).

W. K. Clifford, Lectures, I. 186.

(*c*) In *chem.* and *physics*, one of the very small particles of matter, of the aggregation or combination of which all bodies are assumed to be composed. The diameter of a molecule of hydrogen, consisting of two atoms, has been estimated by Kelvin and others as approximately 5–9 mm. All atoms of a given element are identical as to size, weight, and other properties, but the atoms of the various

elements differ from one another in such a way as to be inconvertible by any known process. Atoms of the elements are assumed to remain intact when compounds are formed. Indeed, it is now assumed that atoms break up, under certain conditions, into still smaller corpuscles.

Hence—**2.** Anything extremely small; a minute quantity: as, he has not an *atom* of sense. —**3†.** The smallest division of time, equal to about $\frac{1}{6}$ of a second.—**4.** Anything indivisible; an individual. = **Syn.** *Molecule*, etc. See *particle*.

If all be atoms, how then should the gods,
Being *atomic*, not be dissoluble,
Not follow the great law? *Tennyson*, Lucretius.

2. Extremely minute.—**Atomic** or **molecular heats of bodies**, the product of the specific heats of bodies into their atomic or molecular weights. These products are nearly the same for all elementary bodies and compounds of like atomic composition, though the products of the specific heats into the atomic weights may differ in different classes of compounds.—**Atomic** or **atomistic philosophy**, a system of philosophy, founded by Leucippus and Democritus, which taught that the ultimate constituents of all things are indivisible particles or atoms, which differ from one another in form and position; whether also in quality of material was disputed among the atomists. From the diverse combination and motions of these atoms all things, including the soul, were supposed to arise. The atomistic philosophy was perfected in its details by the Epicureans, particularly by Lucretius, and was the first complete system of materialism. It is the basis of the modern physical *atomic theory*, but, apart from the numerous special modifications which the progress of modern science has rendered necessary, it differs from it essentially in this, that the ancient atomism was a philosophy of the universe, while modern atomism is, primarily at least, merely a physical theory of the inner structure of matter, constructed for the convenience of physical research.—**Atomic theory**, or **doctrine of atomic composition**, in *chem.*, the hypothesis that all chemical combinations take place between the ultimate particles or atoms of bodies, and that these unite either atom with atom or in proportions expressed by some simple multiple of the number of atoms.—**Atomic volume**, in *chem.*, the space occupied by a quantity of an element in the solid state proportional to its atomic weight, and expressed by the quotient of the atomic weight divided by the specific gravity.—**Atomic weight**, in *chem.*, the number expressing the relative weight of one atom of an element compared with the weight of some unit, usually that of the hydrogen atom. The atomic weights of the other elements, therefore, express how many times the atoms of these elements are heavier than the atom of hydrogen. See *element*.

Sir W. Hamilton, Metaphys., II. 528, App.

The result of *atomism* in any form, dealing with any subject, is that the principle of uniformity is hunted down into the elements of things: it is resolved into the uniformity of these elements or atoms, and of the relations of those which are next to each other.

★**atonement** (a̤-tōn′me̤nt), *n.* [< *atone*, *v.*, + *-ment*; but the noun is found earlier than the verb, arising perhaps from the phrase *at one-ment*: see *onement.*] **1†.** Reconciliation after enmity or controversy; settlement, as of a difference; concord.

Hauying more regarde to their old variaunce than their newe *attonement*. *Sir T. More*, Descrip. of Rich. III.

Our peace will, like a broken limb united,
Grow stronger for the breaking.
Shak., 2 Hen. IV., Iv. 1.

2. Satisfaction or reparation made for wrong or injury, either by giving some equivalent or by doing or suffering something which is received in lieu of an equivalent.

So rich in *atonement* as this
For my dark-dawning youth?
Tennyson, Maud, xix. 2.

3. In *theol.*, the reconciliation of God and man by means of the life, sufferings, and death of Christ.

For God was in Christ, and made agrement bitwene the worlde and hym sylfe, and imputed not their synnes vnto them; and hath committed to vs the preachynge of the *atonement*. *Tyndale*, 2 Cor. v. 19.

When we were enemies we were reconciled to God by the death of his Son; . . . we also joy in God through our Lord Jesus Christ, by whom we have now received the *atonement*. Rom. v. 10, 11.

This doctrine assumes that sin has made a spiritual separation between God and the human soul. Different systems of theology explain differently the method of reconciliation, and therefore use the word *atonement* with different meanings. The early fathers generally stated the doctrine in the terms of Scripture, and it was not until the time of the Reformation that the differences in philosophical statement were clearly marked. The modern statements may be grouped under four general heads, as follows: (*a*) A reparation or satisfaction for sin made by the sufferings of Christ as a substitute for the sinner, and in lieu of the punishment to which the sinner was justly amenable. Such satisfaction is regarded as necessary either (1) to satisfy the justice of God, and so make forgiveness possible, or (2) to satisfy the law of God, produce the public impression which punishment would have produced, and so make forgiveness safe. The former is known as the *satisfaction*, the latter as the *governmental theory.*

The word *atonement*, in its original sense, always denotes some amends, or satisfaction, for the neglect of some duty, or the commission of some fault; a satisfaction with which, when supposed to be complete, the person injured ought reasonably to be contented, and to demand of the offender nothing more on account of his transgression. *Dwight*, Theology, lv.

Taking the term *atonement* in its technical signification to denote the satisfaction of divine justice for the sin of man, by the substituted penal sufferings of the Son of God, we shall find a slower scientific unfolding of this great cardinal doctrine than of any other of the principal truths of Christianity.
Shedd, Hist. Christian Doctrine, v. 1.

(*b*) The entrance of God into humanity, that he may thereby drive out sin and make the human race at one with himself.

Supposing the Father's will to be a will to all good; the Son of God, being one with him, and Lord of man, to obey and fulfil in our flesh that will by entering into the lowest condition into which man had fallen through their sin; this Man to be, for this reason, an object of continual complacency to his Father, and that complacency to be fully drawn out by the death of the cross;—his death to be a sacrifice, the only complete sacrifice ever offered, the entire surrender of the whole spirit and

body to God; is not this in the highest sense *atonement?* is not the true root of humanity revealed? is not God in him reconciled to man? *Maurice*, Theol. Essays.

It [the new theology] holds to the *atonement* as a divine act and process of ethical and practical import—not as a mystery of the distant heavens and isolated from the struggle of the world, but a comprehensible force in the actual redemption of the world from its evil. *T. T. Munger*, The Freedom of Faith.

The majority of orthodox divines, whether in the Roman Catholic or the Protestant churches, ordinarily hold one of the above views or a combination formed from them. In general, the former opinion (*a*) is held in the Calvinistic school of theology, the latter opinion (*b*) in the more modern Broad Church school. (*c*) In *Unitarian theology*, the moral result produced by the influence exerted on mankind by the life and death of Christ, leading men to repentance and to God. This is sometimes known as the *moral influence* theory of the atonement.

Even though we should reject all the Orthodox theories about *atonement*, we may accept the fact. We can believe that God in Christ does reconcile the world to himself,—does create a sense of pardoned sin,—does remove the weight of transgression,—does take away the obstacle in our conscience,—does help us into a living faith, hope, peace, joy. *J. F. Clarke*, Orthodoxy, p. 250.

(*d*) In *New Church* (Swedenborgian) *theology*, the union and accord of flesh and spirit in man, and so the union and accord of man with God by a spiritual change wrought in the individual.

This is what is understood in the New Church by the *atonement*, or at-one-ment, . . . a bringing at one of the human and the divine, or, as the apostle says, "making in himself of twain one new man." And the purpose of this *atonement* was, that the Lord might ever after be able to bring our external or natural at one with our internal or spiritual man—goodness at one with truth in our minds,—and so bring us into complete spiritual union or at-one-ment with himself. *B. F. Barrett*, Doctrine of the New Church.

Doctrine of blood atonement, the doctrine, attributed to the Mormon Church, that the killing of an apostate or of one in danger of apostasy is a deed of love, since it makes atonement for the sin of apostasy, and so makes possible God's forgiveness of it.

2†. Very grievous; violent: as, *atrocious* distempers.—3. Very bad; execrable: as, an *atrocious* pun. [Colloq.]—**Syn. 1.** *Wicked*, *Scandalous*, *Shocking*, *Flagrant*, *Heinous*, *Infamous*, *Outrageous*, *Atrocious*, *Monstrous*, horrible, villainous, flagitious, diabolical, agree in expressing great and intentional badness, calling for strong abhorrence. Because they are used with feeling, the recognition of their differences is not always practicable. *Flagrant* and *heinous* are hardly applicable to persons; the others apply to persons or things. *Wicked* is the generic word, and is the lightest where all are strong; it is the one that is most common in a playful use, yet it is at times an intense word, as forcible as any of the others, though less definite. *Scandalous* means offensive to decency, and so disgraceful. That which is *shocking*, literally, gives a sudden and heavy blow, and hence produces a corresponding feeling of horror or disgust, or both. That which is *flagrant*, literally, flames into notice, and hence is glaring, striking, and so notorious, enormous in badness. *Heinous* means hateful, and hence aggravated. That which is *infamous* is worthy of a total loss of reputation, and hence has a reputation or character of the worst kind, especially for baseness. *Outrageous* means attended with outrage, doing outrage, especially outraging decency, going beyond all bounds, like the acts of a madman. *Atrocious* is primarily fierce or cruel, savage, bloody, and wicked, enormously wicked, hence violating the first principles of humanity or of human nature. That which is *monstrous* is so bad as to be out of the course of nature; a prodigy or miracle of badness. See *abandoned*, *criminal*, *irreligious*, and *nefarious*.

In American usage, *attachment*, when used in reference to property, means the taking of the defendant's property into custody by the law, by a summary process from a court, in advance of the trial of the merits of the case, as security for the payment of any judgment that may be recovered. The grounds of granting it are usually evidence of fraud or fraudulent disposal of property, or apprehension of absconding, etc. When used in reference to the person, it means the taking of the person into custody to answer to a charge of contempt of court. *Foreign attachment* is the taking, from the hands or control of a third person within the jurisdiction, of the money or goods or rights of action of a debtor who is not within the jurisdiction. Any person who has goods or effects of a debtor is considered in law as the agent, attorney, factor, or trustee of the debtor; and an attachment served on such person binds the property in his hands to respond to the judgment against the debtor. The process of foreign attachment has existed from time immemorial in London, Bristol, Exeter, Lancaster, and some other towns in England, and by the Common Law Procedure Act of 1854 has been made general. It is also sometimes known as *garnishment*, in Scotland as *arrestment*, and in New England as *trustee process*.

(See lists under *acquire* and *accomplish*; also note under *attainable*.) *Attain* involves the idea of considerable effort, while *obtain* does not necessarily imply effort at all, and *procure* only a small degree of it: thus, we may *obtain* property by inheritance, we may *procure* a book by purchase, but we can *attain* an end only by exertion. *Attain* generally has higher or more abstract objects than *obtain* or *procure*: as, to *obtain* an office or a patent; to *procure* a chair; to *attain* eminence; *attain* one's end. In these cases it would be ludicrous to use *attain* in place of *obtain* or *procure*.

An *attorney in fact*, sometimes called a *private attorney*, is an attorney authorized to make contracts and do other acts for his principal, out of court. For this purpose a written authority is usual, but verbal authority is in general sufficient. For the performance of some acts, however, as conveyance of land, transfer of stock, etc., a formal power of attorney is necessary. An *attorney at law*, sometimes called a *public attorney*, is a person qualified to appear for another before a court of law to prosecute or defend an action on behalf of such other. The term was formerly applied especially to those practising before the supreme courts of common law, those practising in chancery being called *solicitors*. Under the present English system, all persons practising before the supreme courts at Westminster are called *solicitors*. In England attorneys or solicitors do not argue in court in behalf of their clients, this being the part of the *barristers* or *counsel*; their special functions may be defined to be: to institute actions on behalf of their clients and take necessary steps for defending them; to furnish counsel with the necessary materials to enable them to get up their pleadings; to practise conveyancing; to prepare legal deeds and instruments of all kinds; and generally to advise with and act for their clients in all matters connected with law. An attorney, whether private or public, may have *general* powers to act for another, or his power may be *special*, and limited to a particular act or acts. In the United States the term *barrister* is not used, the designation of a fully qualified lawyer being *attorney and counselor at law*. When employed simply to present a cause in court, an attorney is termed *counsel*. In Scotland there is no class of practitioners of the law who take the name of *attorneys*. See *advocate*, 1.

★**attraction** (a-trak′shon), *n.* [= F. *attraction*, < L. *attractio(n-)*, < *attrahere*, attract: see *attract.*] **1.** The act, power, or property of attracting. Specifically—(*a*) In *phys.*, the force through which particles of matter are attracted or drawn toward one another; a component acceleration of particles

toward one another, according to their distance. Such attraction is a mutual action which in some form all bodies, whether at rest or in motion, exert upon one another. The attractive force with which the atoms of different bodies in certain cases tend to unite, so as to form a new body or bodies, is called *chemical affinity;* that which binds together the molecules of the same body is called *cohesion;* those of different bodies, *adhesion.* Connected with the last-named forces is *capillary attraction,* by which liquids tend to rise in fine tubes or small interstices of porous bodies. In all the cases mentioned the forces act only through very small distances. When bodies tend to come together from sensible distances, the force being directly proportional to the product of their masses and inversely proportional to the square of the distance between them, the attraction is called *gravitation,* as when the earth attracts and is attracted by a falling body, or attracts and is attracted by the moon, etc.; or *magnetism,* as when exerted between the unlike poles of a magnet; or *electricity,* as when dissimilarly electrified bodies attract one another. See *capillary, chemical, cohesion, electricity, gravitation, magnetism.* (*b*) The power or act of alluring, winning, or engaging; allurement; enticement: as, the *attraction* of beauty or eloquence.

=**Syn.** *Attribute, Ascribe, Refer, Impute, Charge,* have two meanings in common: they may assign some attribute, quality, or appurtenance to a person or thing, or they may connect different things, as an effect with its cause. *Refer* is the weakest. *Attribute* is stronger: as, to *attribute* omniscience to God; to *attribute* failure to incompetence. *Ascribe,* being most manifestly figurative, is the strongest and most common; it is rarely used in a bad sense. That which is *imputed* in the first sense named is generally but not always bad: as, to *impute* folly to a man. To *impute* anything good seems an archaic mode of expression. *Impute* is not very common in the second sense: as, to *impute* one's troubles to one's follies. The theological meaning of *impute,* that of laying to a person's account something good or bad that does not belong to him, has affected but little the popular use of the word. That which is *charged,* in either of the senses named, is bad: as, "His angels he *charged* with folly," Job iv. 18; I *charged* it to their youth and inexperience. The word is a strong one, on account of its connection with legal processes, etc.

The singular excellence to which eloquence attained at Athens is to be mainly *attributed* to the influence which it exerted there. *Macaulay*, Athenian Orators.

I have never yet encountered that bitter spirit of bigotry which is so frequently *ascribed* to Mohammedans.
B. Taylor, Lands of the Saracen, p. 24.

The salts, predominant in quick lime, we *refer* rather to lixiviate than acid. *Boyle*, Colours.

And more, much more. *Shak.*, Lear, v. 3.

attribute (at′ri-būt), *n.* [< L. *attributum,* predicate, attribute, lit. what is ascribed, neut. of *attributus,* pp. of *attribuere,* ascribe, attribute: see *attribute, v.*] **1.** In *logic,* that which is predicated or affirmed of a subject; a predicate; an accident.

A predicate, the exact limits of which are not determined, cannot be used to define and determine a subject. It may be called an *attribute,* and conveys not the whole nature of the subject, but some one quality belonging to it.
Abp. Thomson, Laws of Thought, p. 120.

The term *attribute* simply directs the attention to the fact that we attribute to, or affirm of, a being something that we distinguish from itself.
N. Porter, Human Intellect, § 642.

2. A character inseparable from its subject.

By this word *attribute* is meant something which is immovable and inseparable from the essence of its subject, as that which constitutes it, and which is thus opposed to *mode.* *Descartes.*

Some necessary marks belong to things as reasons of other marks of the same things, others as consequences of other marks. . . . The latter are called *attributes.*
Kant.

3. A characteristic or distinguishing mark; especially, an excellent or lofty quality or trait: as, wisdom and goodness are his *attributes.*

Serv. . . . with him the mortal Venus, the heart-blood of beauty, love's invisible soul.
Pan. Who, my cousin Cressida?
Serv. No, sir, Helen: could you not find out that by her *attributes?* *Shak.*, T. and C., iii. 1.

The term *attribute* is a word properly convertible with *quality,* for every *quality* is an *attribute,* and every *attribute* is a *quality;* but custom has introduced a certain distinction in their application. *Attribute* is considered as a word of loftier significance, and is, therefore, conventionally limited to qualities of a higher application. Thus, for example, it would be felt as indecorous to speak of the *qualities* of God, and as ridiculous to talk of the *attributes* of matter. *Sir W. Hamilton*, Metaph., I. 151.

4. In the *fine arts,* a symbol of office, character, or personality: thus, the eagle is the *attribute* of Jupiter.

The ladder is a striking *attribute* for the patriarch Jacob, and the harp for King David. *Fairholt.*

Why we ascribe it to him. *Shak.*, T. and C., ii. 3.

In this fine age, were not thought flattery,

3. Authority or function granted, as to a ruler, minister, or court.

It is not desirable that to the ever-growing *attributions* of the government so delicate a function should be superadded. *J. S. Mill.*

attributive (a-trib′ū-tiv), *a.* and *n.* [= F. *attributif,* < L. as if **attributivus,* < *attribuere:* see *attribute.*] **I.** *a.* **1.** Pertaining to or having the character of attribution: as, the *attributive* use or relation of certain words; *attributive* qualities or insignia; an *attributive* judgment (in logic).—**2.** In *gram.*, pertaining to or expressing an attribute; used (as a word) in direct description without predication: as, a *bad* pen, a *burning* house, a *ruined* man. An attributive word is to be distinguished from a *predicative:* as, the pen is *bad;* the man is *ruined;* and from an *appositive:* as, the pen, *bad* as it is, might be worse; this man, *ruined* by another's misconduct, is in misery. All adjective words, as proper adjectives, adjective pronouns, and participles, may be used attributively; also nouns: as, a *pine* table; a *gold* ring; my *hunter* friend; the young *soldier*-boy. The relation of an adverb to the adjective qualified by it is also by some called attributive.

These were people trained by *attrition* with many influences. *E. S. Phelps*, Beyond the Gates, p. 119.

3. In *theol.*, imperfect contrition or repentance, with real detestation of sin, and a true purpose of amendment, arising from those supernatural motives of faith which are lower than charity, or the true love of God for his own infinite perfections. Such motives are a love of justice for its own sake, the intrinsic shamefulness of sin, the fear of divine punishment, etc. *Attrition* remits sin only when complemented by the grace conferred through sacramental absolution. See *contrition.*

These auspices were studied, with a fixed ceremonial, in the following classes of phenomena: (1) signs from the heavens, including thunder and lightning, and other meteorological manifestations; (2) signs from the direction of flight or the various cries of birds; (3) signs from the manner of eating of domestic hens kept for this purpose; (4) signs from the movements and attitudes of animals; (5) evil omens from various fortuitous incidents, such as the fall of any object, the gnawing of a mouse, the creaking of a chair, etc., occurring during the augural ceremonies, or when these were about to begin. The official or public augurs, who constituted a college, probably founded by Numa, were originally three in number. By the time of Tarquin they had been increased to six. After 300 B. C. the number became nine, of whom five must be plebeians. Sulla made the number fifteen; Julius Cæsar, sixteen, not including his own official membership in his character of perpetual chief priest and dictator; and toward the close of the empire the number was still further increased. The augurs wore the sacerdotal prætexta, or toga with a broad purple border, and their distinctive emblem was the curved rod called the *lituus*, with which they marked out the limits of the templum or boundary within which the omens with which they had to do were to be observed. Before any public business or ceremony was undertaken the augurs decided whether the auspices were propitious, or whether unfavorable omens demanded interruption or delay; they conducted the inauguration or exauguration of priests, temples, and places, such as new settlements, and fixed the times of movable festivals. In the engraving, the figure holds the lituus in his right hand, while one of the sacred fowls appears at his feet.

It abounded on both coasts of the North Atlantic, nearly or quite to the arctic circle, and south on the American side to Massachusetts. The name came to be also specifically applied to the razor-billed auk, *Alca* or *Utamania torda*, a similar but much smaller species, about 15 inches long, with a white line instead of a spot before the eye; and finally, as a book-name, it was made synonymous with *Alcidæ*. This animal was once abundant in many parts of the continent of Europe, especially in the neighborhood of large forests. The spread of population has nearly exterminated it, and were it not for the protection afforded by the emperor of Russia to a few herds which inhabit the forests of Lithuania and of Kuban in the Caucasus, it would soon become extinct. Also called *urochs*, *urox*, and, wrongly, *auroch* and *aurock*. See *urus*.

The relationships of the *aurochs* to the American bison, while very close, do not warrant that specific identity

Aurochs (*Bison bonasus*).

3. The aurora borealis or the aurora australis (the polar lights).

The most probable theory of the *aurora* is that originally due to Franklin, namely, that it is due to electric discharges in the upper air.
S. P. Thompson, Elem. Lessons in Elect. and Mag., p. 264.

4. A reddish color produced by dyeing with arnotto.—**Aurora australis**, the aurora of the southern hemisphere, a phenomenon similar to the aurora of the north.—**Aurora borealis**, the boreal or northern dawn; the northern lights or streamers; a luminous meteoric phenomenon appearing at night. It usually manifests itself by streams of light ascending toward the zenith from a dusky line of cloud or haze, a few degrees above the horizon, and stretching from the north toward the west and east, so as to form an arc, with its ends on the horizon. Sometimes it appears in detached places; at other times it covers almost the whole sky. As the streams of light have a tremulous motion, they are called in many places "the merry dancers." They assume many shapes and a variety of colors, from a pale red or yellow to a deep red or blood-color; and in the northern latitudes they serve to illuminate the earth and cheer the gloom of the long winter night. The appearance of the aurora borealis so exactly resembles the effects of artificial electricity that there is every reason to believe that their causes are identical. When electricity passes through rarefied air it exhibits a diffused luminous stream which has all the characteristic appearances of the aurora, and hence it is highly probable that this natural phenomenon is occasioned by the passage of electricity through the upper regions of the atmosphere, although under conditions not as yet entirely understood. Auroral displays are usually accompanied by disturbances of the magnetic needle, and by a great increase of the intensity of the electric earth currents, to such an extent as to interfere with telegraphic communication, and are most frequent and brilliant at periods of great solar activity (sunspots). The aurora borealis is said to be frequently accompanied by sound, which is variously described as resembling the rustling of pieces of silk against each other, or the sound of wind against the flame of a candle. The spectrum of the aurora is peculiar in consisting of a prominent line in the greenish-yellow (citron line), which has not been identified with ★any known substance.

4. Severely simple; unadorned.=**Syn. 2.** *Austere*, *Severe*, *Stern*, *Hard*, *Harsh*, *Strict*, *Rigorous*, *Rigid*, stiff, uncompromising, relentless, may characterize a person's dealings with himself or with others. *Austere* is the most individual word in the list; it still suggests the etymological sense of dryness and hardness of nature. As applied to manner of life, it implies self-mortification, refusal of pleasure, or the self-infliction of pain, for the purpose of self-discipline. The *austere* man may treat others as he treats himself; an *austere* manner is of a corresponding sort. There is no suggestion of hypocrisy or self-righteousness in the word, nor does it go so far as asceticism (see *self-denial*). *Severe* starts from the notion of seriousness or freedom from levity, but extends through a wide range, covering most of the meanings of the other words. *Stern*, while primarily meaning fixed in facial expression, applies to almost anything to which *severe* can apply. *Hard* is of the same character, but starts from the notion of physical hardness, proceeding thence to mean difficult to endure, unfeeling, etc. *Harsh* primarily expresses physical roughness, as a *harsh* touch, and retains some figurative suggestion akin to that idea. *Strict* is drawn close, tense, not relaxed, observing exact rules for one's self or requiring such observance from others. *Rigorous* means, literally, stiff, and hence allowing no abatement or mitigation; inflexible; unsparing. *Rigid* is the same as *rigorous*, but with somewhat more of the original figurativeness than in *rigorous*; both are opposed to *lax* or *indulgent*. *Rigid* is more often used of unnecessary, overwrought, or narrow-minded strictness than *rigorous*. We speak of *austere* morality; a *severe* aspect, treatment, tone; a *stern* rebuke; a *hard* master, voice, judgment; *harsh* enforcement of laws; *strict* rules, discipline, repression of mischief; *rigorous* justice; *rigid* adherence to petty restrictions. See *acrimony*.

He [Plutarch] was not so *austere* as to despise riches, but being in possession of a large fortune, he lived, though not splendidly, yet plentifully. *Dryden*, Plutarch.

Argument from authority. Same as *argumentum ad verecundiam* (which see, under *argumentum*).—**Constituted authorities,** the magistrates or governors of a nation, people, municipality, etc.—**General authority,** the authority of a general agent, intended to apply to all matters which arise in the course of business, as distinguished from special instances, though it may be limited to a particular business and to a particular place.=**Syn. 1.** Rule, dominion, government; warrant, permission, authorization.—**2.** *Influence, Authority, Ascendancy, Control, Sway, Domination,* may all apply to persons or things, but seem primarily to belong to persons. *Influence* and *authority* imply moral power; the others may do so, and are considered to do so here. The words are arranged in the order of their strength. *Influence* may be small; it is wholly apart from the power of office; the word expresses the extent to which one affects the conduct or character of others simply by their deference to him on account of his station, wealth, ability, character, etc. *Authority* is, in this connection, influence amounting to a recognized right to command: as, the *authority* of age, wisdom, experience. It is presumably rightful, while the other words often express undue or unwholesome weight or power. *Ascendancy* is overmastering influence, supremacy by influence; the word is often used in a bad sense: as, the *ascendancy* of cunning over simplicity. *Control* is complete or successful and continued authority: as, his *control* over the convicts was maintained without resort to force. *Sway* is, by its derivation, control over that which may be viewed as a weighty or massive object; hence, a solid or powerful or controlling influence. *Domination,* as it may be an absolute and tyrannical rule, may also be an absolute and tyrannical influence or ascendancy: as, he was really under the *domination* of those whom he thought his servants or tools.

Mourn for the man of amplest *influence*,
Yet clearest of ambitious crime.

Ure, Dict., I. 274.

3. In *physiol.*: (*a*) Not voluntary; not under the control of, or not effected by, volition: said of certain muscular actions.

Let me briefly notice some of our other *automatic* actions. In the act of swallowing, which properly begins at the back of the throat, the "swallow" lays hold of the food or the drink brought to it by the muscles of the mouth and carries this down into the stomach. We are quite unconscious of its passage thither unless we have taken a larger morsel or something hotter or colder than ordinary. This is an instance of purely *automatic* action.
W. B. Carpenter.

In animals, too, to a far greater extent than in plants, is the *automatic* activity which always resides in protoplasm itself transmitted by the mechanism of the organization to different parts of the organism or to the whole of it.
L. F. Ward, Dynam. Sociol., I. 353.

(*b*) Not reflex: said, for example, of certain activities of ganglion-cells.—**Automatic brake.** See *brake*.—**Automatic coupling.** See *coupling*.—**Automatic mallet.** Same as *dental hammer* (which see, under *hammer*).—**Automatic theory.** Same as *automatism*, 2.

II. *n.* A self-moving vehicle designed to travel on common roads; specifically, a wheeled vehicle for use on roads without rails, which carries in itself a mechanical motor, with its source of power. Automobiles are distinguished from *locomotives* by the fact that they do not travel on a fixed track, and both from *locomotives* and *traction engines* by carrying loads instead of drawing them in other vehicles. The number of wheels may be two (bicycle), three (tricycle), four, or more. Those with four wheels (the commonest form) are built for nearly every variety of purpose of ordinary vehicles, such as carriages and cabs for two or more persons, omnibuses, merchants' delivery-wagons, and drays. Automobiles are usually provided with pneumatic tires and ball bearings. The four-wheel electric automobile may be taken as a type of these vehicles. The front wheels are controlled by a steering-handle or -wheel and the driving wheels connected with an electric motor on the rear axle through the medium of a balance or compensating gear, so that one wheel may revolve slower than the other in turning the vehicle. The motor derives its power from a battery of storage cells within the body of the vehicle, which are coupled in parallel or in series for various speeds by means of a controller placed under the vehicle, and shifted from one position to another by a hand-lever, to which it is connected by a chain-and-sprocket gear. In certain positions of the controller the automobile is made to run backward at different speeds. A foot-lever is connected with band-brakes which act on surfaces formed on the peripheries of the internal gears which are attached to the driving-wheels. The vehicle is provided with meters for measuring the electric current, and with electric lights and an electric gong. Automobiles are named according to the number of wheels, when this is less than four, as *automobile bicycle* and *automobile tricycle;* and according to the kind of motor used, as *compressed-air automobile, electric automobile,*

Winter avalanches or snow-slides often recur year after year on the same path, which is thus kept clear of trees. When a mountain railroad must cross such a path, the road-bed is usually cut beneath the path, and the track is covered with a heavy shed, across which the avalanche may pass; but the shed is sometimes swept away. In the summer avalanches are less destructive, because they then mostly take place high above habitations and forests. Partly consolidated snow, or névé, is sometimes set in motion in large quantities, and such an occurrence may be productive of very serious injury, especially to the forests below. The blast of air, brushed forward by the avalanche, often has a destructive strength beyond the reach of the snow itself. Small glaciers sometimes detach themselves from their rocky beds and slide into the valley below; such events are rare, but have sometimes been attended by very disastrous results. "Rock-avalanches" are more properly denominated land-slips or land-slides. See *land-slip, land-slide.*

=**Syn.** *Avarice, Covetousness, Cupidity*, penuriousness, closeness, miserliness, all denote bad qualities, corruptions of the natural instinct of possession. *Avarice*, literally greediness, a strong desire to get objects of value, has become limited, except in figurative uses, so as to express only a sordid and mastering desire to get wealth. *Covetousness* and *cupidity* are not limited to wealth, but may have for their object anything that can be desired, *cupidity* being directed especially toward material things. *Covetousness* longs to possess that which belongs to another; hence the prohibition in the tenth commandment (Ex. xx. 17). *Cupidity* is more active than the others, less grovelling, and more ready to snatch from others that which *covetousness* may wish for without trying to get. Ave Maria, the Hail Mary, a devotion or prayer used in the Western Church. In the older form it consists of the salutation of the angel Gabriel to the Virgin Mary when he announced to her the incarnation (Luke i. 28), together with the words of Elizabeth to Mary (Luke i. 42). This form of the Hail Mary was used as an anthem in both the Eastern and Western churches as early as the seventh century. It came into wide use as a devotion in the eleventh century. The concluding words, "Holy Mary, Mother of God, pray for us," etc., were first introduced in the fifteenth century, and first authorized for daily use in the breviary in 1568. Also called the *angelic salutation*. See *angelus*.

F. *œuvre*, < L. *opera*, work: see *opera*, *ure*[2], *manœuver*.] In *old law*, a kind of service owed by tenants to their superior. The nature of the service is not clear. (*e*) A contribution made by the owners of a ship's freight and cargo, in proportion to their several interests, to make good a loss that has been sustained or an expense incurred for the general safety of the ship and cargo. Aves (ā′vēz), *n. pl.* [L., pl. of *avis*, a bird; cf. Skt. *vi* = Zend *vi*, a bird. Cf. also *ovum* and *egg*[1].] Birds; feathered animals, considered as a class of vertebrates, next after mammals: sometimes united with *Reptilia* in a superclass *Sauropsida*, distinguished on the one hand from *Mammalia*, and on the other from *Ichthyopsida*, or amphibians and fishes together. *Aves* are defined by the following characteristics: a body covered with feathers, a kind of exoskeleton no other animals possess; hot blood; completely double circulation; perfectly 4-chambered heart; single and dextral aortic arch; fixed lungs; air-passages prolonged into various air-sacs, even into the interior of some of the bones of the skeleton; oviparous reproduction; eggs large and meroblastic, with copious food-yolk and albumen and a hard calcareous shell; limbs 4 in number, the anterior pair of which are modified as wings, and generally subserve flight by means of their large feathers, the distal segment of the limb being compressed and reduced, with not more than 3 digits, usually not unguiculate; the metacarpals more or less ankylosed as a rule, and the free carpals normally only 2 in adult life; a large breast-bone, usually carinate, and great pectoral muscles; numerous dorsolumbar, sacral, and urosacral vertebræ ankylosed into a sacrarium; ilia greatly produced forward, and ilia and ischia backward, normally without median symphyses; perforate cotyloid cavity; the trochanter of the femur articulating with an iliac antitrochanter, and the fibula incomplete below; the astragalus ankylosed with the tibia, and assisting in forming the tibial condyles; mediotarsal ankle-joint; not more than 4 metatarsals, 3 ankylosed together, and not more than 4 digits, the phalanges of which are usually 2, 3, 4, or 5 in number; the hind limb fitted as a whole for bipedal locomotion; and no teeth in any recent forms, the jaws being sheathed in horn. Birds have undergone little modification since their first appearance in the Jurassic age; their classification is consequently difficult, and no leading authors agree in detail. Linnæus (1766) divided them into 6 orders: *Accipitres, Picæ, Anseres, Grallæ, Gallinæ*, and *Passeres.* Cuvier's arrangement (1817) was similar, with the 6 orders *Accipitres, Passerinæ, Scansores, Gallinæ, Grallæ*, and *Palmipedes.* A system said to have been originally proposed by Kirby, and formerly much in vogue among English ornithologists, recognized *Natatores, Grallatores, Cursores, Rasores, Scansores, Insessores*, and *Raptores* as orders. The latest artificial system is that of Sundevall (1872–3), with the orders *Oscines, Volucres, Accipitres, Gallinæ, Grallatores, Natatores, Proceres*, and *Saururæ*, 42 subordinate groups, and 1,229 genera. In 1867 Huxley divided birds into 3 orders: *Saururæ, Ratitæ*, and *Carinatæ;* the latter into 4 suborders, *Dromæognathæ, Schizognathæ, Desmognathæ*, and *Ægithognathæ*, and 16 superfamily groups—an arrangement very different from any preceding one. The discovery of *Odontornithes*, or toothed birds, led to another primary division by Marsh into *Odontolcæ, Odontotormæ*, and *Saururæ*, this author not extending his classification to recent birds. In 1884 Coues divided all birds into 5 subclasses: (1) *Saururæ*, with teeth, amphicœlous vertebræ, carinate sternum, separate metacarpals, and long, lizard-like tail; (2) *Odontotormæ*, with socketed teeth, biconcave vertebræ, carinate sternum, ankylosed metacarpals, and short tail; (3) *Odontolcæ*, with teeth in grooves, heterocœlous vertebræ, rudimentary wings, ratite sternum, and short tail; (4) *Ratitæ*, without teeth, with heterocœlous vertebræ, ratite sternum, rudimentary wings, ankylosed metacarpals, and short tail; (5) *Carinatæ*, without teeth, with heterocœlous vertebræ, carinate sternum, developed wings, ankylosed metacarpals, and short tail. The *Carinatæ* include all living birds, except the few struthious or ratite birds. For the carinate subclass or order, some 15 or 20 ordinal or subordinal groups are now usually adopted. One of these, *Passeres*, includes a large majority of all birds. The genera or subgenera of birds in use now range from about 1,200 to about 2,900. The species are usually estimated at about 12,000. It was introduced into England from Bayonne about A. D. 1300, and is substantially the Spanish system. In avoirdupois weight 7,000 troy grains (once approximately made but now exactly) make a pound, while in troy weight the pound contains 5,760 grains, the grain being the same in both cases; hence, 175 pounds troy are equal to 144 pounds avoirdupois. (For its use in the U. S. see below.) The pound avoirdupois is the standard weight of Great Britain, and is equal to 453.6 grams in the French metric system. Avoirdupois weight is used in determining the weights of all commodities except gems and the precious metals. It is reckoned as follows:

	Cwt.	Qrs.	Pounds.	Ounces.	Drams.
1 ton	= 20	= 80	= 2240	= 35840	= 573440
1 hundredweight	=	4	= 112	= 1792	= 28672
1 quarter		=	28	= 448	= 7168

The modern ax consists of a head of iron, with an arching edge of steel, and a helve or handle. The edge is in the plane of the sweep of the tool, thus differing from the adz, in which the edge is at right angles to the plane of the sweep. As a weapon, the ax was in very common use from the earliest times until the general adoption of firearms. It was used by the Egyptians. By the Greeks it was looked upon as a weapon of their own ancestors and of the Asiatic nations, and so figured in works of Greek art. The northern nations who overthrew the Roman empire used many varieties of this weapon, and its use prevailed throughout the middle ages in Europe. A light ax was common among the Arabs and Moors. axiolitic (ak″si-ō-lit'ik), *a.* Of, pertaining to, or of the nature of axiolite.

axiom (ak'si-ọm), *n.* [< L. *axioma*, < Gr. *ἀξίωμα*, that which is thought fit, a requisite, that which a pupil is required to know beforehand, a self-evident principle, < *ἀξιοῦν*, think fit or worthy, require, demand, < *ἄξιος*, worthy, fit, lit. weighing as much as, of like value, < *ἄγειν*, drive, lead, also weigh, = L. *agere*, drive, do, etc.: see *act*, *v.*, *agent*, etc.] 1. A self-evident, undemonstrable, theoretical, and general proposition to which every one who apprehends its meaning must assent. The Greek word was probably applied by Plato (though it does not occur in his dialogues in this sense) to certain first premises of mathematics; and this continues to be the ordinary use of the term. It was extended by Aristotle to similar principles supposed to underlie other branches of knowledge. The axioms or "common notions" of Euclid, as given in English translations, are twelve in number, viz.: (1) Things which are equal to the same are equal to one another. (2) If equals be added to equals, the wholes are equal. (3) If equals be taken from equals, the remainders are equal. (4) If equals be added to unequals, the wholes are unequal. (5) If equals be taken from unequals, the remainders are unequal. (6) Things which are double of the same are equal to one another. (7) Things which are halves of the same are equal to one another. (8) Magnitudes which coincide with one another, that is, which exactly fill the same space, are equal to one another. (9) The whole is greater than its part. (10) Two straight lines cannot inclose a space. (11) All right angles are equal to one another. (12) If a straight line meets two straight lines, so as to make the two interior angles on the same side of it taken together less than two right angles, these straight lines, being continually produced, shall at length meet upon that side on which are the angles which are less than two right angles. Only the first three of these are universally acknowledged to be authentic, though the latest editor, Heiberg, allows the eighth and ninth also. Euclid gives besides a list of *postulates*, which, as given in English translations, are: (1) Let it be granted that a straight line may be drawn from any one point to any other point. (2) That a terminated straight line may be produced to any length in a straight line. (3) And that a circle may be described from any center, at any distance from that center. What the English editions give as the eleventh and twelfth axioms formed originally the fourth and fifth postulates, and in the best MS. the tenth axiom appears as the sixth postulate. It would thus seem that he understood by "postulate" a geometrical premise which was asked to be taken for granted, and by "axiom" or "common notion," a not specially geometrical principle with the use of which the learner would be already familiar. This agrees with Aristotle's definition of an *axiom* as a principle which he who would learn must bring of himself. The Leibnitzians distinguish a *postulate* as a self-evident practical principle from an *axiom* as a self-evident theoretical principle. According to Kant, an axiom is a necessary and general synthetical proposition which declares a property of pure space or time and rests directly on intuition, and is thus self-evident. He refused the name to the genuine "common notions" of Euclid, holding these to be analytical propositions. Modern mathematicians seem to regard the axioms of geometry as an analysis of the independent properties of space, so that the longer the list, provided the propositions are really independent, the more perfectly has the design been fulfilled. Many eminent mathematicians hold that there is no reason to think these axioms to be exactly true, but that they must be assumed to be slightly erroneous one way or the other; although experience shows that they approximate so nearly to the truth that it may be doubted whether it will ever be possible to measure the amount of their error. A similar doctrine is held by some thinkers concerning metaphysical axioms, such as the axiom that every event is determined by causes.

2. Any higher proposition, obtained by generalization and induction from the observation of individual instances; the enunciation of a general fact; an empirical law. This use originated with Bacon, influenced probably by the employment of *axiom* by the Stoics to mean any proposition.

Earlier history unknown; possibly orig. a dial. form of *ay,* ever, always, worn down to a mere particle of assent. It was originally referred to the *Rodentia,* and was described as a species of *Sciurus,* or squirrel. It is a small squirrel-like animal (so far as its long bushy tail, general configuration, and arboreal habits may warrant the comparison), with large thin ears opening forward, great eyes looking forward, a very peculiar physiognomy, and an attenuated middle finger, which seems as if withered. The thumb is not apposable, in which respect it is unlike the inner digit of the foot. The animal is nocturnal, arboreal, and peculiar to Madagascar. Its economy is still imperfectly known. The meaningless name *aye-aye* was in 1802 or 1803 made a barbarous generic name by Lacépède. In the Western Church azyms seem to have been used as far back as positive testimony goes, but the evidence either for or against their use in the earlier centuries is very scanty. In the Eastern Church consecration of leavened bread seems to have been the universal rule since the earliest times, but some early Oriental sects used azyms. The Latin Church does not hold that the use of leavened bread invalidates consecration. The controversy between the Eastern and Western churches as to azyms turns mainly on the question whether the Last Supper was within the period of unleavened bread, and whether therefore the holy communion was instituted with azyms or not.

We have shunned the obscurity of the papists in their *azymes*, tunick, &c.
The Translators of the Bible to the Reader.

★

B, 1. The second letter in order in the English alphabet, as it was in the Phenician, and has been in most other alphabets derived from the Phenician. (See *A*.) The name of the Phenician character was *beth*, meaning house; from this comes the Greek name, *beta*. The Phenician *beth*, with some early Greek and Latin forms of *b*, and with the ancient Egyptian characters, hieratic and hieroglyphic, from which the others are by many authorities supposed to be ultimately derived, are given below:

Egyptian. Hieroglyphic. Hieratic. Phenician. Early Greek and Latin.

The value of the character is the same in all these alphabets. It is a labial sonant (or voiced) mute (or stop, or check); that is, it is made with the lips alone, by a complete closure cutting off all exit of breath from the mouth, but with accompanying sonant vibrations of the vocal chords, the current of air necessary to produce this being driven from the lungs into the closed cavity of the mouth. The corresponding surd (or voiceless) mute is *p*. (See *P*.) *B* has nothing of that variety of pronunciation shown by most English letters; but it is sometimes silent, as when final after *m*, in *lamb*, *limb*, *tomb*, *thumb*, and in a few other cases, as *debt*, *doubt*. In most of these cases *b* is a modern graphic insertion, and was never pronounced (in the English forms); *e. g.*, *limb*, *thumb*, *debt*, *doubt*. In the fundamental or Germanic part of our language a *b* comes from a more original aspirate found in Sanskrit as *bh*, in Greek as *φ* (*ph*), in Latin usually as *f*. Examples are: E. *brother* = Skt. *bhrātar* = Gr. *φράτηρ* = L. *frater*; E. *bear*[1] (v.) = Skt. √ *bhar* = Gr. *φέρειν* = L. *ferre*. With the English *b* corresponds that of most of the other Germanic dialects. In the original Indo-European or Aryan language *b* was nearly or altogether wanting.

2. As a numeral, B was used by the Hebrews and Greeks, as now by the Arabians, for 2.—3. As a symbol: (*a*) In *music*, the seventh tone, or "leading tone," of the model diatonic scale, or scale of C. B was the last tone to be adopted into the modern major scale. It was the first note to be modified by lowering its pitch a semitone; its two forms, the *b rotundum* or B flat (♭) and the *b quadratum* or B natural (♮) (see below), afterward became conventional signs which were applied as accidentals to all the notes of the scale. See *accidental*, *n.*, 1. In Italian and French the same note is called *si*. In German use *B* denotes B flat, while B natural is represented by *H*, and is called *ha*. (*b*) In *chem.*, the symbol of *boron*. (*c*) In *ornith.*, the accessory femorocaudal muscle, one of the chief classificatory muscles of the leg. *A. H. Garrod*. (*d*) In *math.*, see *A*, 2 (*c*). (*e*) In abstract reasoning, suppositions, etc., the second or other person or thing mentioned: as, if A strike *B*. (*f*) In general, the second in any series: as, Company B (of a regiment), schedule B, etc.; in the form *b*, or b, the second column of a page, in a book printed in columns.—4. As an abbreviation, B. stands for—(*a*) *Bachelor* (or Middle Latin *Baccalaureus*), in B. A. or A. B., B. C. E., B. D., B. L., B. M., etc. See these abbreviations. (*b*) In dates, *before*, as in B. C. or B. C., and *born*, as in *b.* 1813. (*c*) In a ship's log-book, in the form *b.*, *blue sky*. (*d*) In hydrometric measurements, *Baumé*: as, 8° *B*. See *Baumé's hydrometer*, under *hydrometer*. Also *Bé.*—**B, or B flat,** an English humorous euphemism for *bug* (*Cimex lectularius*).—**B cancellatum,** in *music*, the sharp: so called because it was originally indicated by crossing or canceling the symbol of B quadratum.—**B quadratum,** in *music*, literally square B, a modified form (♮) of the black-letter **b** used before the invention of accidentals to denote B natural in distinction from B flat: now used as the natural. See *accidental*, *n.*, 1.—**B rotundum,** in *music*, literally round B, a modified form (♭) of the Roman letter b first used to denote B flat, as distinguished from B quadratum: it is now the conventional sign of the flat. See *accidental*, *n.*, 1.—**Not to know B from a bull's foot, or a broomstick, or a battledore,** to be very illiterate or very ignorant: popular alliterative comparisons, the first dating from the Middle English period.

'lord,' or 'owner,' applied to any deity, then to a particular deity; pl. *ba'alīm*.] The name of a Semitic solar deity worshiped, especially by the Phenicians and their descendants the Carthaginians, with much license and sensuality. Baal was derived from the Babylonian Bel, a deity of a much higher type, and was merged in the Tyrian Melkarth. In its original generic sense of 'lord,' the name was applied to many different divinities, or, with qualifying epithets, to the same divinity regarded in different aspects and as exercising different functions. Thus in Hos. ii. 16 it is applied to Jehovah himself, while *Baal-berith* (the covenant-lord) was the god of the Shechemites, and *Baal-zebub* (the fly-god) the idol of the Philistines at Ekron. *Baal-peor* (lord of the opening) was a god of Moab and Midian, probably the same as Chemosh. The word enters into the composition of many Hebrew, Phenician, and Carthaginian names of persons and places, as *Jerubbaal*, *Hasdrubal* (help of Baal), *Hannibal* (grace of Baal), *Baal-Hammon*, *Baal-Thamar*, etc.

Officers chosen by the people were to have unlimited powers to divide the product of the industry of all, according to the needs and requirements of each. 3†. [From a former common identification by Protestants of the "scarlet woman," "Babylon the great, the mother of harlots and abominations" (Rev. xvii. 5), with the Papacy.] (*a*) Popish. (*b*) Scarlet.—**Babylonian art**, a subdivision of Mesopotamian art; the later development of Chaldean art as practised at Babylon, both prior to the Assyrian domination, which began in the eleventh century B. C. and culminated in the ninth century, and after the restoration of the Babylonian kingdom, under Nabopolassar, about 600 B. C. The architecture of Babylon, like that of Assyria, of which it was the model, employed as its chief material of construction the sun-dried brick, and held in general to the thick walls and massive forms which were imposed by this friable material. Stone was much more scarce in Babylonia than in Assyria; hence Babylonian decoration adhered in the main to painting on a surface of plaster for interiors, and to brilliantly enameled tiles, often forming pictorial subjects of great size and variety, for exteriors. In Babylonia, contrary to Assyrian practice, the temple, rising pyramidally in stages, each ascended by broad flights of steps, and each of a distinct color, was the most important development of architecture, the royal palace being subordinated to it. The scarcity of stone rendered sculpture scanty; but the gem-cutter's art produced cylinders or seals in great plenty and of much merit, and pottery, metal-work, and textile fabrics attained great perfection. See *Mesopotamian art*, and compare *Chaldean art* and *Assyrian art*, under the adjectives. —**Babylonian quartz.** Same as *Babel quartz* (which see, under *quartz*).—**Babylonian scale**, the sexagesimal scale of numeration, which originated in Babylonia.

baccara, baccarat (bak-a-rä′), *n.* [F.; origin unknown.] A variety of vingt-et-un played by any number of persons from 3 to 11. The privilege of being the banker is sold to the highest bidder and the amount bid is placed on the table. The players draw for positions, since the banker pays those nearest him first, right and left alternately, as long as his capital lasts. Three packs of cards are shuffled together and the players stake on the right or left, as they choose. *Banco* is a challenge to the banker to play for his entire capital, and takes precedence of any other bets. The banker gives a card to the player nearest him on his right, then one on his left, and then one to himself. He repeats this and then all three examine their two cards. Court cards and tens count nothing, all others at their pip value, and the object of the game is to secure cards which add up nearest to 8 or 9. When the pip value ends with a cypher it is "baccara," nothing. Eight made with two cards is better than 9 made with three. If any of the three players holds a point of 8 or 9 he shows it immediately. If the banker has 8 or 9 and neither adversary holds so many, the banker wins everything on the table; right and left. If either adversary has more than the banker, all bets on that side of the table must be paid. If either ties the banker, all bets on that side are a stand-off. If either has less than the banker, all bets on that side, right or left, are lost.

Bacchus (bak'us), *n.* [L., < Gr. Βάκχος, another name of Dionysus, the god of wine; also one of his followers or priests. Also called Ἴακχος, prob. related to *ἰάχειν*, shout, with allusion to the noisy manner in which the festival of Dionysus was celebrated.] In *classical myth.*, a name of Dionysus, the son of Zeus (Jupiter) and Semele, and the god of wine, personifying both its good and its bad qualities. It was the current name of this god among the Romans. The orgiastic worship of Bacchus was especially characteristic of Bœotia, where his festivals were celebrated on the slopes of Mount Cithæron, and extended to those of the neighboring Parnassus. In Attica the rural and somewhat savage cult of Bacchus underwent a metamorphosis, and reached its highest expression in the choragic literary contests in which originated both tragedy and comedy, and for which were written most of the masterpieces of Greek literature. Bacchus was held to have taught the cultivation of the grape and the preparation of wine. In early art, and less commonly after the age of Phidias, Bacchus is represented as a bearded man of full age, usually completely draped. After the time of Praxiteles he appears almost universally, except in archaistic examples, in the type of a beardless youth, of graceful and rounded form, often entirely undraped or very lightly draped. Among his usual attributes are the vine, the ivy, the thyrsus, the wine-cup, and the panther. See *Dionysia*, *mænad*, and *thiasus*.

The word seems to have been at first a technical law term, and may be explained as an artificial translation of the equiv. OHG. *hagustalt*, the holder of a small farm, an unmarried man, a soldier, etc., from *hag*, hedge, inclosure (= E. *haw*[1]), + *stalt*, connected with Goth. *staldan*, AS. *stealdan*, possess, own. In later times the word was supposed to be a compound of *bacca* + *laurus*, laurel (see *baccalaureate*), or (as spelled *bacularis*) a derivate of *baculum*, a staff.] 1. 2. In universities and colleges: (*a*) Before the fifteenth century, a young man in apprenticeship for the degree of master in one of the higher faculties, that is, of theology, law, or medicine. (*b*) In modern use, a person who has taken the first degree (baccalaureate) in the liberal arts and sciences, or in divinity, law, medicine, etc., at a college or university: as, a *bachelor* of arts; a *bachelor* of science. See *baccalaureate*. Originally, a bachelor had not necessarily taken any degree whatever; but after the fourteenth century the word, without ceasing to carry this signification, was also applied to a determinant, or young man who had taken the lowest degree in the faculty of arts. This degree seems to have been conferred not by the chancellor nor by the faculty, but only by the "nation." It was not accompanied by any regular diploma, but testimonial letters were furnished if desired. In order to be admitted to the degree, it was requisite for the candidate to be fourteen years of age, to have followed a three years' course in logic in the university, and also to sustain a disputation, called the determinance. There were in the middle ages three orders of bachelors of theology. The lower order consisted of the *ordinary biblics* and *cursors*, the duty of the former being to read and expound the Bible from beginning to end, and that of the latter to give one course of lectures upon a book of the Old and another upon a book of the New Testament, which books they chose at pleasure. Bachelors of the second order of theology were called *sententiary bachelors*, because they publicly read and expounded the Book of the Sentences of Peter the Lombard. It was not, however, till late in the thirteenth century that any bachelor was permitted to lecture on the Sentences. According to the law, the lectures of the sententiary bachelors had to include the reading of the text of the author, and the explanation of it phrase by phrase; and they were forbidden to trench upon questions of logic and metaphysics. They also made certain acts called *principia*. See *principium*. As soon as the sententiary had completely finished the exposition of the Sentences, he became a *formed bachelor* (*baccalarius formatus*), and had still to continue his theological studies for three years longer before he could be licensed to preach and to teach as a master.

[NL., < Gr. *βακτήριον*, a little stick, dim. of *βακτηρία*, a staff, stick, < *βάκτρον*, a staff, stick, akin to L. *baculum*, a staff: see *baculus.*] 1. One of the micro-organisms which are concerned in the putrefactive processes, and are known as *Schizomycetes*, or fission fungi, in distinction from *Saccharomycetes*, or budding fungi, which produce alcoholic fermentation. Their true character was long in doubt, but they are now generally regarded as the lowest forms of vegetable life, and are known to multiply, in some species at least, by the formation of spores. They consist of exceedingly minute spherical, oblong, or cylindrical cells, without chlorophyl, multiply by transverse division, and may be found anywhere. Their origin and the part they take in putrefaction, fermentation, and disease have been the subject in recent years of much study and discussion. Very much remains in doubt, but there is no question of the importance of these investigations from a sanitary point of view. It also appears to have been demonstrated that the bacteria which exist in the soil are active in changing otherwise inert substances into matter suitable for the food of plants, converting the nitrogenous matter of organic origin into soluble nitrates. The genera and species have been variously defined, and are necessarily based on slight characters. Migula has divided the group into five families: (1) *Coccaceæ*, with spherical or subspherical cells mostly without flagella and non-motile. (2) *Bacteriaceæ*, with flagellate or non-flagellate cylindrical cells. (3) *Spirillaceæ*, having variously curved or spirally twisted cells with or without flagella. (4) *Chlamydobacteriaceæ*, with cells forming threadlike colonies inclosed in a sheath. (5) *Beggiatoaceæ*, having the cells in filaments, but the sheath lacking.

A former view makes ME. *badde* a generalized adj. use (with loss of *-l*, as in ME. *muche* for *muchel*, < AS. *mycel*, much; ME. *lyte* for *lytel*, < AS. *lytel*, little; ME. *wenche* for *wenchel*, < AS. *wencel:* see *much, mickle, lite, lyte, little*, and *wench*) of a noun, **baddel*, < AS. *bæddel* (twice, in glosses), with equiv. deriv. *bædling* (suffix *-ing*[3]), an effeminate person, a hermaphrodite. (Cf. the similar development of the adj. *wicked*, ME. *wicked, wikked*, earlier *wicke, wikke*, from the noun AS. *wicca*, m., a witch, wizard, hence an evil person: see *wicked*[1].) The word can have no connection with Goth. *bauths*, deaf and dumb, with G. *böse*, bad, or with Corn. *bad*, Ir. Gael. *baodh*, foolish, etc. AS. *bæddel*, ME. **baddel*, is scarcely found in literature, but, like other words of similar sense, it may have flourished in vulgar speech as an indefinite term of abuse, and at length, divested of its original meaning, emerged in literary use as a mere adj., *badde*, equiv. to the older *evil.* The adj. first appears at the end of the 13th century, and does not become common till the 15th century. In high literary use it is comparatively rare, as against *evil*, till the 18th century. Thus, the white hart of Richard II. is represented in different attitudes, and is not described in the language of blazon. A figure for a badge might also be chosen arbitrarily, as the boar of Richard III. (For its technical characters, see *Melinæ*.) The common European species, to which the name was first applied, is *Meles vulgaris* or *Meles taxus;* it is about 2 feet long, of heavy and clumsy shape, low on the legs, with a short thick tail, a long snout, and long claws fitted for digging. The general color is grizzled gray, with dark limbs, and black and white stripes on the head. This animal inhabits temperate and northerly portions of Europe and Asia. Its flesh is used as food, its pelt in furriery, and its hair for making shaving-brushes and the kind of artists' brushes called *badgers*. In a state of nature the animal is less fetid than some of the other species. The American badger, *Taxidea americana*, resembles the foregoing, but differs in the dental formula and some other technical characters; it is a common animal in the western States and Territories, and in some regions, as the Missouri watershed, it is very abundant. The Indian badger is *Arctonyx collaris;* it is also called *sand-bear* and *bear-pig*. The Javanese skunk (so called from its extreme fetidness), the teledu or telego, *Mydaus meliceps*, is a true badger. See cut under *teledu*. It originated in the East, was known to the Greeks and Romans, was popular in Europe throughout the middle ages, and is still used in many eastern countries, as well as among the country people of Poland, Italy, the south of France, and in Scotland and Ireland. Though now often regarded as the national instrument of Scotland, especially Celtic Scotland, its origin and use seem to belong to the Celtic race in general. In its best-known form it has four pipes. One of these, called the *chanter*, has a double reed and eight finger-holes, so that melodies may be played upon it. Its compass may be approximately indicated thus:

There are three other pipes, called *drones*, with a single reed, which give a continuous sound, and are tuned in various ways. There are several kinds of bagpipes, as the Scotch (Highland and Lowland), which is the most important, most characteristic, best known, and perhaps the oldest; the English, or perhaps more properly Northumbrian, a feeble instrument, no longer in use; and the Irish, which is the most elaborate and most in accordance with modern ideas of musical accuracy. The word is now used chiefly in the plural, especially in Scotland.

3. Security given to obtain the release of a prisoner from custody, pending final decision in the action against him. In civil cases a person arrested has always the right to give sufficient bail, and thereupon be released from custody. In criminal cases the defendant has also this right, as a rule, when the crime charged is a mere misdemeanor. Whether to bail one charged with treason or felony is usually in the discretion of the judge, and in some states bail is always denied to one held for a crime punishable with death. The security is in the form of a bond executed by responsible sureties, providing that the defendant shall appear at the order of the court under penalty of forfeiture of the sum named in the bond. The person bailed is regarded as but transferred from the custody of the law to that of his sureties, who may therefore seize and surrender him at any time. In civil cases there are several kinds of bail at common law, the chief being *common bail* and *special bail. Common bail*, or *bail below*, which is now disused, was given to the sheriff on a bail-bond entered into by two persons, on condition that the defendant appear at the day and in such place as the arresting process commands. *Special bail, bail above*, or *bail to the action*, is given by persons who undertake generally, after appearance of a defendant, that if he be condemned in the action he shall satisfy the debt, costs, and damages, or render himself to the proper person, or that they will do so for him. (*Wharton.*) In Scotland, bail in civil cases is called *caution* (which see).

A. Sala.*

The genus is the type of a family *Balæniciipidæ,* of somewhat uncertain position, probably near the storks. The bird is remarkable for its enormous vaulted beak, which is much longer than the head. Little is known of its habits and economy. It is a large species, standing upward of 3 feet high. The bill somewhat resembles that of the boat-billed heron, *Cancroma cochlearia.* See cut in preceding column.

balance (bal′ans), *n.* [< ME. *balance, balaunce,* early mod. E. also *ballance, belaunce,* etc., < OF. *balance,* F. *balance* = Pr. *balansa* = Sp. *balanza, balance* = Pg. *balança* = It. *bilancia,* < LL. **bilancia,* a balance, < *bilanx* (acc. *bilancem*), adj., in *libra bilanx,* a balance having two scales, < L. *bi-, bis,* twice, + *lanx,* a dish, scale of a balance. See *bi-*², *lance*², *launce*², and *auncel.*] **1.** An instrument for determining the weight of bodies as compared with an assumed unit-mass. In its simplest and most scientific form it consists of a horizontal lever, having its fulcrum (which is a knife-edge) just above the center of gravity of the whole balance, and carrying two pans suspended as delicately as possible (preferably from knife-edges) at equal distances on the right and left of the fulcrum. It also carries a tongue-pointer or index (a slender rod) rigidly attached to the middle of the beam or lever, and extending vertically up or down. Except in coarse balances, there is a divided scale, over which the end of the tongue moves in the oscillations of the balance. All delicate balances are protected from currents of air by glass cases, and they have contrivances for steadying the pans, and often for removing the knives from their bearings and for replacing them. Exceedingly delicate balances are sometimes inclosed in vacuum-chambers, and have machinery for changing the weights. In using the balance, the substance to be weighed is placed in one pan or scale and the weights are put in the other, and different combinations of weights are tried until the pointer oscillates at equal distances to one side and the other of the position it has when the scales are empty. In chemical balances the last adjustment is obtained by moving a minute weight, or rider, to different points on the decimally graduated beam. The figure shows the beam of a balance of precision. It is so formed as to combine stiffness with lightness, and there are various adjustments for moving the center of gravity, the knife-edges, etc. Other things being equal, the greater the length of the arms and the smaller the distance of the center of gravity below the center of suspension, the greater will be the sensibility of the balance or the angular amount of the deviation produced with a given slight addition to either scale. The degree of sensibility to be desired depends upon the use to which the instrument is to be put. Such a balance as is employed in accurate chemical analysis will indicate a difference of weight of a tenth or hundredth of a milligram.

Beam and neighboring parts of a Balance of Precision.

A A, beam; *B,* knife-edge on which it turns; *C, C,* knife-edges fixed to the beam on which the pans are hung; *D, D,* the bearing-pieces of the pans; *E,* tongue, the lower extremity of which moves over a scale; *F,* screw with a nut for raising and lowering the center of gravity: this has no connection with the horizontal rod *I I;* *G,* screw with a nut for carrying the center of gravity toward one or the other pan; *H,* a rider, or little weight, whose value depends on its position on the beam, which it straddles; *I I,* rod sliding horizontally, with a hook to take up and set down the rider; *K K,* piece which raises and lowers the levers, *L, L;* *L, L,* levers to take the beam and pans simultaneously off their bearings when the weights are to be changed; *M, M,* knobs supporting the beam when the levers, *L, L,* are raised; *N, N,* Y's supporting the pans when the levers, *L, L,* are raised. Many balances have arrangements for adjusting the relative positions of the three knives, but these are discarded in the larger balances.

Specifically—**6.** In *mining*, a counterpoise or counterweight used in such a way as to assist the engine in lifting the load.—**7.** The part of a clock or watch which regulates the beats: formerly, a pin oscillating on its center, and thus resembling the beam of a balance; now, a wheel. See *balance-wheel.*—**8.** The arithmetical difference between the two sides of an account: as, to strike a *balance.*—**9.** The sum or amount necessary to balance the two sides of an account, usually spoken of as a *debit* or a *credit balance:* as, I have still a *balance* at my banker's; a *balance* still due.—**10.** A surplus; a remainder; the rest; the residue; what remains or is left over: as, he bequeathed the *balance* of his estate to A. B.; the *balance* of a meal. [A colloquial use, of commercial origin.]—**11.** A balanced condition; a state of equilibrium or equipoise: as, to lose one's *balance.*

(*Ortolan.*) The leading rule by which it has been sought to effect this in Europe has been to oppose every new arrangement which threatens either materially to augment the strength of one of the greater powers or to diminish that of another.

The meaning of the *balance of power* is this: that any European state may be restrained from pursuing plans of acquisition, or making preparations looking towards future acquisitions, which are judged to be hazardous to the independence and national existence of its neighbors.
Woolsey, Introd. to Inter. Law, § 43.

The balance is said to be *favorable for* or *in favor of* a country when the value of its exports exceeds that of its imports, and *unfavorable* when the value of its imports exceeds that of its exports.—**Bent-lever balance.** See *tangent-balance.*—**Compensation balance.** See *compensation.*—**Danish balance,** a weighing apparatus somewhat resembling the steelyard, but differing from it in having the fulcrum movable, the weight being at one end and the load at the other; the loop by which it is suspended is shifted along the beam until equilibrium is established. The weight of the substance in the scale-pan is indicated by the point at which the fulcrum is placed when the instrument is in equilibrium.—**Electric balance.** See *absolute electrometer*, under *electrometer; differential galvanometer*, under *galvanometer; induction-balance; Wheatstone's bridge*, under *resistance.*—**Expansive balance,** a compensation-balance in watches, consisting of a compound rim whose outer and inner portions are made of metals having different rates of expansion by heat. The scales are at the top. The advantage of the contrivance is, that it makes it a matter of indifference at what point on the pan the object to be weighed, or the counterpoise, is placed. An improved form of this balance is commonly used to weigh articles sold by druggists.—**Roman balance,** a steelyard (which see).—**Spring-balance,** a contrivance for determining the weight of any article by observing the amount of deflection or compression which it produces upon a helical steel spring properly adjusted and fitted with an index working against a graduated scale. Another form of spring-balance is made in the shape of the letter C, the upper end being suspended by a ring, and the lower end affording attachment for the hook whereby the object is suspended. As the bow opens a finger traverses a graduated arc and registers the weight.—**Thermic** or **actinic balance.** Same as *bolometer.*—**To cast the balance,** to turn the scale; cause one scale to preponderate: often used figuratively. *South; Dryden.*—**To hold in balance,** to keep in a state of uncertainty or suspense.

To pay a balance, to pay the difference and make two accounts equal.—**Torsion-balance,** an instrument for measuring certain electrical forces and the intensity of magnets. It consists of a magnetic needle suspended by a silk thread or a very fine wire in a glass cylinder, of which the circumference is graduated. balance-barometer (bal′ans-ba-rom″e-tėr), *n.* A barometer consisting of a beam balanced on a pivot, and formed, on opposite sides of the pivot, of materials differing greatly in specific gravity. The bulks of the parts on either side of the fulcrum, and consequently the volumes of air displaced by them, thus differ greatly. If the air becomes lighter, the reverse happens. The vibrations are noted upon a scale.
